# Questionnaires

## Overview

---

The questionnaire was published in English, a translated questionnaire was on hand when on demand by the respondent.

The questionnaire design differed slightly from the design of previous census questionnaires. As usual, government departments were asked to submit a list of questions on any specific topic they would like to add. Responses were not forthcoming in this census, although a few new questions were included.

There were two types of questionnaires used in the census: the household questionnaire and the individual questionnaire. An enumerator manual was prepared to assist the enumerators in their duties.

The questionnaire was pre-tested by the enumerators before they were to go out for field enumeration.

### Data Collection Notes

---

The recruitment of Census Enumerators and other census workers were mainly of government employees from different government departments.

The consideration of the Enumerator recruitment was based on:

- Experience as enumerators of previous censuses project so the concept was not new to them,
- basic knowledge of the content of the census for example the definitions
- basic knowledge of their prescribed knowledge area of enumeration, the residents and land of use making easy for them to relate to the householders

Training for Enumerators was held on the 5th of September 2011. The trainings were half-day sessions. The first session was held in the morning from 9.00am to 12.00pm, this group was the Northern side of the island. The second group consisted of the Southern side which started at 1.00pm to 4.00pm.

For both training sessions, the enumerators concentrated on the concept and definitions used in the census. The enumerators also conducted mock interviews amongst themselves and completed sample copies of questionnaires. This not only gave them the necessary practical experience in completing the questionnaires but also served to highlight those aspects of the questionnaires that were not fully understood by all the enumerators.

The country was divided to 21 Enumeration Areas (EA) for the enumeration purposes. This division was based on the Population and Household Census 2006 and Agriculture Census 2009. The final updating of household lists was carried out by the enumerators themselves on the 7th of September and pre-census count of population and households was set for the weekend of 10th September 2011.

The enumeration and filling of questionnaires began on the 9th September and concluded on the 14th September 2011. This was sufficient time for enumerators to collect the data information as they were expected to work throughout the weekend and 3 to 4 hours in the evenings considering the appropriate time respondents of households returned home from their normal day activities.

The enumerator was expected to take at least half an hour to complete the questionnaires. No major problems were experienced with the enumeration and all households were covered during the given time.

The tasks of the enumerators was made easy due to the fact that not only were they selected from the EA's they were familiar with but with less than 500 households in Niue most individuals knew each other.

The interview was mostly done in English, however translation to Niuean was given where applicable.

A Pilot Census was not conducted.

## Supervision

For the 2011 Population and Household Census there was a total of 2 supervisors to 17 enumerators. They were tasked to make regular checks with the enumerators about the progress of their work. A staff member from the Statistics New Zealand Census Team was able to join the Statistics Niue team as another supervisor/enumerator.

# Data Processing

## Data Editing

---

Census processing began as soon as questionnaires were checked and coded. Forms were checked, edited and coded before being entered into the computer database.

Data processing was assisted by the Secretariat of the Pacific Community (SPC) using the computer software program CPro for data entry and for generating tables. Tables were then exported to Excel for analysis.

Occupation and Industry were coded using the United Nations International Standard Classification of Occupation and International Standard Industrial Classification.

It is standard practice that as each area was completed the forms were first checked by the field supervisors for missing information and obvious inconsistencies. Omissions and errors identified at this stage were corrected by the enumerators.

The next stage was for the field supervisors to go through the completed forms again in the office to check in more detail for omissions and logical inconsistencies. Where they were found, the supervisors were responsible to take the necessary action.

Once the questionnaires had been thoroughly checked and edited, they were then coded in preparation for data processing.

Checking, editing and coding of the questionnaires in office were done after normal working hours as to ensure that the confidentiality of the survey is well observed.

## Other Processing

---

The selection for Data Entry Operator selected needed to be a non-Public Servant as entry had to be done during working hours and overtime. This was so data entry would be completed within one week.

Data Entry was conducted manually at the National Statistics Office by 3 data entry operators. The software that was used was CPro 4.1 with a highly structured data entry program, using systems controlled approach that controlled entry of each variable. A total of 3 computers were used for the data entry.

A staff member from the Statistics New Zealand Census team was able to aid us with tabulations design before the TA from SPC arrived to start data entry.
