## PREFACE AND ACKNOWLEDGMENTS

This detailed population and housing profile based on the 2005 Census of the Republic of Palau will help local and international policy makers understand current socioeconomic conditions in Palau. The monograph stands alone, although the Basic Tables for the *2005 Census of Population and Housing, Republic of Palau* report and detailed tables available at the Office of Planning and Statistics (OPS), and the website: [www.palau.gov.net/stats](http://www.palau.gov.net/stats), contain more information.

Although the Republic provided funding for census enumeration and most of the processing and analysis for each of its three censuses, OIA provided financial support for the preparation of the previous monographs as well as the current one. The 1995 Republic of Palau Census of Population and Housing was the first to be conducted entirely by the Republic itself, with technical assistance from the Census Bureau. A monograph was developed after that census, also, but was distributed only in draft form. In November 2004, staff from OPS traveled to Washington, D.C. to complete a first ever monograph based on the 2000 Census of Population and Housing, after the 1990 Census monograph. This undertaking was successful, and Palau published its first Census monograph. This 2005 Census report is the second to be published by OPS. Michael J. Levin of the U.S. Census Bureau and Kyonori Tellames of OPS developed the tables, charts, and maps for this volume, as well as writing the text.

## DERIVED MEASURES

The presentation and analysis of census data typically employ various *derived measures*, calculations and coefficients that measure certain characteristics of the data and help to isolate particularly important trends. The general derived measures that appear throughout this document, notably means, medians, and percentages, are discussed here. Other measures, like various types of housing vacancy rates and fertility measures, are discussed in those portions of the monograph that deal with these subjects.

The *mean* is the arithmetic average of a set of values. The mean of a set of numbers is calculated by dividing the sum of all values in the set by the number of members in the set. The use of the mean as a measure of central tendency for a particular collection of data often is augmented with the standard deviation, a measure of how representative the mean is. However, for the sake of simplicity and brevity this report avoids technical statistical concerns and focuses entirely on the mean itself.

The *median* is another measure of central tendency. For a particular set of numbers, the median is that value that divides the set into two halves: half the values are less than the median and the other half are greater than the median. This report computes medians on the basis of each distribution as tabulated. For example, median household income employs the income data presented in the published report for the 2005 census; it rounds values to the nearest dollar, consistent with the presentation of the data themselves. In the case of interval data, the calculation of medians often uses *interpolation* to estimate a figure between two known values. For instance, the calculation of median age uses interpolation to estimate a representative age. Interpolation, unless otherwise stated, is linear.

Finally, this report makes frequent use of *percentages*. For a given topic, this measure helps to assess the relative position of a particular value with respect to the remaining values. One calculates percentages by dividing the value of interest (like the number of individuals aged 4 years or less) by the sum of all observations (the total number of persons

enumerated). Closely associated with percentages are *rates* and *ratios*. The former tend to measure the degree of change over time, through comparing an absolute change to the total that existed prior to the change; for instance, the rate of housing growth for one year is the number of housing units added (or lost) over the year divided by the number that existed at the beginning of the year. Ratios, in turn, often compare selected numbers to one another, with the result founded on a base of 100; as an example, the male-to-female ratio is the number of males in a population per 100 females.

Office of Planning and Statistics  
May 2006

## CHAPTER 1. INTRODUCTION

The 2005 Republic of Palau Census of Population and Housing was the third census collected and processed entirely by the Republic itself. This monograph provides analyses of data from the most recent Palau census for decision makers in and outside Palau to understand current socioeconomic conditions<sup>1</sup>. The monograph chapters explore topics using data primarily from the 2005 Republic of Palau Census of Population and Housing, but also from the Japanese censuses of the 1920s and 1930s, censuses coordinated by the Trust Territory of the Pacific Islands (TTPI) Administration, U.S. Census Bureau's 1970, 1980 and 1990 censuses, and the 1995 and 2000 Republic of Palau censuses.

Chapter 1 provides background for the analyses, introducing the Republic of Palau, providing a brief history of Palau, and discussing key analytical concepts. Chapter 2 presents a brief overview of the demographic history of Palau. Chapters 3 through 17 explore particular topics for 2005 with reference to earlier censuses, as follows:

- Chapter 3: Geographic distribution
- Chapter 4: Age and sex
- Chapter 5: Households, families, and marital status
- Chapter 6: Fertility
- Chapter 7: Mortality
- Chapter 8: Migration
- Chapter 9: Education and language
- Chapter 10: Religion
- Chapter 11: Labor force participation
- Chapter 12: Occupation, industry and class of worker
- Chapter 13: Income and poverty
- Chapter 14: Estimates and projections
- Chapter 15: Housing characteristics
- Chapter 16: Comparisons of Palauans living inside and outside Palau
- Chapter 17: Comparisons with the United States and its territories

Finally, appendices present information on various technical topics. Appendix A discusses data accuracy, borrowing heavily from the 1990 Palau Census of Population and Housing collected by the U.S., and Palau's own censuses. Appendix B presents a facsimile of the questionnaire used in the 2005 census.

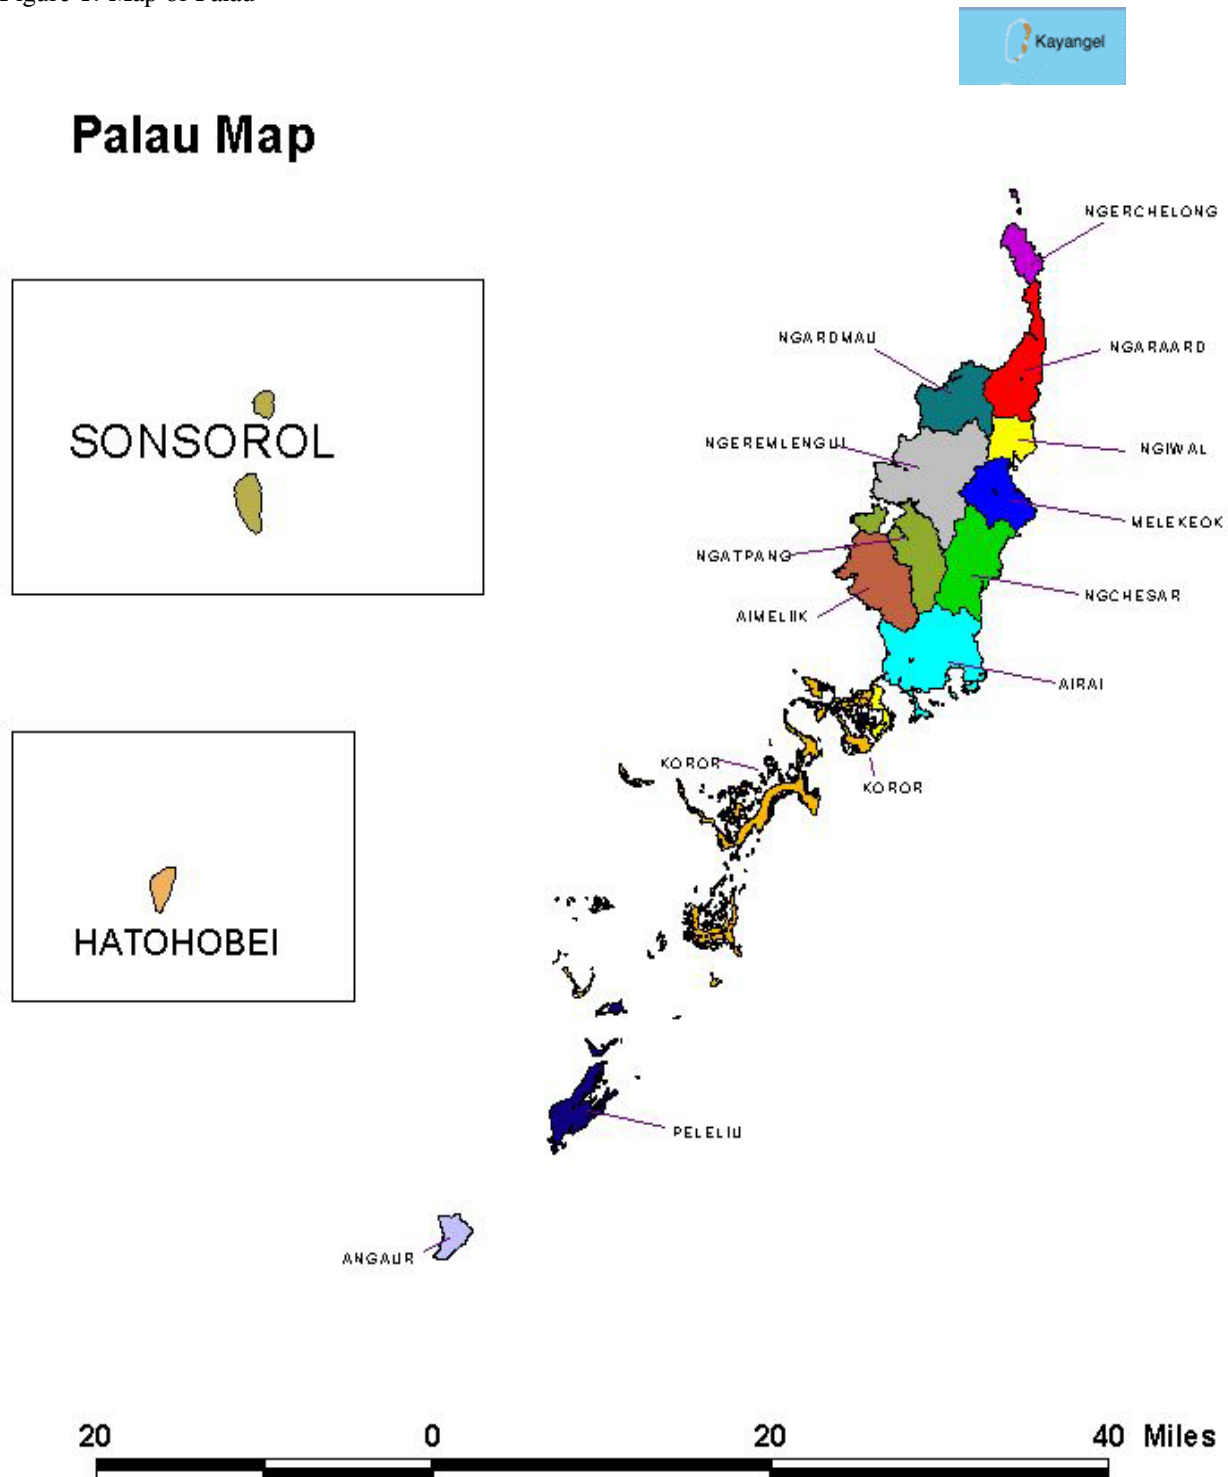

<sup>1</sup> This monograph presents a detailed analysis of the 2005 Republic of Palau Census of Population and Housing. The Republic of Palau's Office of Planning and Statistics collected the data for this analysis with the Office of Insular Affairs, Department of the Interior providing technical assistance from the U.S. Census Bureau. Cross-tabulations were prepared in Koror and Washington, D.C. by Michael Levin and Kyonori Tellames, and released by the Republic of Palau government in December 2005. Additional data, both on topics not covered in this main published report and for geographical divisions not shown in the report, are contained in summary files, available from the Office of Planning and Statistics.

---

**THE REPUBLIC OF PALAU**

The Republic of Palau consists of six island groups found at the western edge of the Caroline archipelago in the west central Pacific Ocean (Figure 1.1) (Shinn, 1984, pp. 341-342). The more than 340 individual islands lie along a 700-kilometer length from northeast to southwest. The main island group, called the *Palau Islands*, contains most of Palau's 189 square miles of land area and most of its population. Peleliu and Angaur are to the south, and Kayangel lies to the northeast. The *outer islands* — the four southwest islands of Sonsorol, Hatohobei, Merir, and Pulo Ana have a different culture and history.

Figure 1. Map of Palau

The northern portion of the Palau Islands is volcanic in origin, characterized by deep dendritic drainage patterns and rounded hills (U.S. Department of Agriculture, 1983, pp. 1-2). Included among the volcanic islands is Babeldaob<sup>2</sup>, the largest island in the republic, as well as Arakabesang, Koror, and Malakal islands. Raised coral limestone islands, known collectively as the "Rock Islands," lie scattered throughout the lagoon. Finally, the southern portion of the main island group consists of the low coral and limestone islands of Angaur and Peleliu. Soil quality and tropical climate of high humidity and warm, relatively uniform year-round temperatures, produce dense vegetation over most islands of the Palau Islands and provide a natural setting for agriculture. In contrast, the rest of the Palau Islands are low coralline islands characterized by limited land and poor soil. Vegetation on the coral islands generally is sparse and the agricultural productivity potential more limited than on the volcanic islands (Useem, 1946:61).

Kayangel is an *atoll* — an irregular ring of coral reef surrounding a lagoon, with some parts of the reef rising slightly above sea level to form dry areas called *islets* (see Wiens, 1962).

The southwest islands of Palau are small and formed primarily from coral. All are raised coral islands. Sonsorol, Merir, Fanna, and Pulo Ana are the four municipalities of Sonsorol, one of Palau's states. Hatohobei is another of the 16 states. Vegetation on the outer islands generally is sparse because of porous, poor soil and high salinity both in the ground water and from ocean spray. Due in part to the fundamentally different adaptive challenges faced by outer island residents, in part to their history, and in part to geographic separation, the Southwest Islands are distinct culturally from the Palau Islands. The Southwest Islands have closer links to the outer islands of Yap through their language and migration patterns.

During traditional times, Palau contained chiefdoms — socio-cultural systems characterized by hierarchical social ranking. Matrilineal descent determined social position, inheritance, kinship structure, residence patterns, and land tenure. A single chiefdom inhabited each smaller island unit, as on Hatohobei and Peleliu. Several chiefs resided on the large island of Babeldaob, dividing the island into separate districts that individual chiefs controlled. Although Palau society has changed dramatically over the past 300 years of contact with people from outside Micronesia, traditional society continues to play important roles both in daily activities and in the political operation of the republic, particularly in more rural areas.

As is the case with most of Micronesia, Palau has a long history of interaction with more technologically advanced societies. In many cases this interaction has had profound effects on the native residents, leading to population change, introducing different strategies of economic development, and ultimately changing the traditional sociocultural system. A brief overview of this history provides useful background for an examination of the 2005 Census of Population and Housing.

### **A Brief History of Palau**

Early colonists from the Philippines or eastern Indonesia probably settled the Palau Islands between 2000 and 3000 B.C. (Hezel, 1983:3). Most of the outer islands, in contrast, apparently were settled sometime during the first millennium B.C. from the east, as part of a general wave of Micronesian colonization that flowed westward from the Marshall Islands and Kiribati. The islands of Oceania, including those within the current Republic of Palau, were unknown to the West until the 16th century through European "discovery". In May 1522 a Spanish ship commanded by Espinosa sighted the Sonsorol Islands as it sailed northeast from the Philippines (Hezel, 1983, pp. 3-4). About two decades later another Spanish ship, commanded by Villalobos, possibly sighted the Palau Islands (Office of the Chief of Naval Operations, 1944, pp. 22). Europeans finally made landfall in 1579 when Francis Drake, the famous English privateer, landed on one of the Palau Islands (Lessa, 1975; Hezel, 1983:32). But as occurred throughout most of Micronesia, European interest in Palau waned. Europeans would not see the islands of the republic again for nearly 150 years.

Brief contact occurred once again between Spaniards and the people of Palau in the early 1700s, when ships explored unknown islands that native informants in the Philippines had referred to as "the Pelews." A Spanish ship commanded by Padilla began this effort in 1710, landing first on Sonsorol (Dongosaro) and then on the Palau Islands. A second

<sup>2</sup> Because of the various colonial and post-colonial administration's differing spelling preferences, the same entity may appear in different parts of the monograph spelled in different ways. Also, written Palauan requires differences as well — we try to maintain use of "Palau" in English and "Belau" when Palauan phrases are presented.

Spanish ship, under captain Egui, returned two years later (Krämer, 1917:71; Office of the Chief of Naval Operations 1944:22; Hezel 1983:43). But Spanish efforts to discover, explore, and Christianize these islands again were short-lived. When more prolonged contact finally began about 50 years later, it was by British ships — inspired by commercial goals and initiated primarily by the Honorable East India Company. British visits to Palau focused initially (during the 1760s) on the Southwest Islands (Hezel, 1983, pp. 60, 63). During the 1780s, British ships also began to land on the Palau Islands. The wreck of the East India Company ship *Antelope* on a reef west of Koror in 1783 provided an unlikely beginning to prolonged British trade with the people of Palau (see Peacock, 1987, pp. 24-29). Befriended by a native chief, the shipwrecked crew remained on Palau for three months while they constructed a new ship. The knowledge the crew gained on Palauan society, and the interest in Western material culture they generated among the natives, provided a valuable foundation for future interaction. Fueled by the hope of potential trade and an increased familiarity with the natives of Palau, British and Spanish ships continued to call intermittently on various islands during the early 1800s, making Palau one of the most highly acculturated parts of Micronesia outside the Mariana Islands. By the mid-19th century, a few traders came to dominate most interaction between the residents of Palau and Europeans — including Andrew Cheyne, who hoped to establish the center of his Pacific trading empire at Koror. Unfortunately, years of overexploitation eventually depleted many of the marine resources of interest to Europeans, and trading emphasis in the western Carolines shifted to Yap. By the 1870s, most European attention on Palau focused upon scientific research — particularly that conducted by naturalist Jan Kubary, who spent several years in residence at different times during the 1870s and 1880s (Kubary, 1873, 1895, 1900a, 1900b).

As occurred elsewhere in Micronesia, Spain became more active in Palau during the second half of the nineteenth century — primarily to assert its sovereignty in the face of increasing commercial (trading) competition in the area from other European nations. To gain control of the region, German military forces occupied several main islands in the Pacific (including Palau) in 1885. Papal arbitration by Pope Leo XIII settled the dispute between Spain and Germany later that same year, preserving the sovereignty of the former but granting trading and other commercial rights to the latter (Hezel, 1983, pp. 312-313). Despite having its authority recognized internationally, Spain's activity in Micronesia continued to be minimal and its hold on the area tenuous (Force and Force, 1972:5). With the exception of dispatching a few Capuchin priests to establish a mission on Koror and the maintenance of a small military garrison nearby, little evidence exists of Spanish anywhere in the republic (Office of the Chief of Naval Operations, 1944:24). Disputes over sovereignty in Micronesia became moot in 1899 when Germany purchased the Caroline and Northern Mariana Islands following Spain's defeat in the Spanish-American War (Brown, 1977).

The Germans were much more active in administering their newly acquired Pacific islands than were their Spanish predecessors. Motivated primarily by the hope of developing the region commercially, the Germans expanded these activities as copra production (Force and Force, 1972:5). To administer its Micronesian possessions, Germany established a network of government offices on main islands throughout the Carolines and Northern Marianas, with a branch office established in Koror in 1905 and another on Angaur in 1910 (Office of the Chief of Naval Operations, 1944, pp. 24-25). Although most daily administrative functions remained in the hands of native chiefs, all decisions ultimately were subject to German supervision. In addition to their administrative role, the Germans built roads, conducted numerous studies of the area, and in general attempted to improve the lives of the native residents. On the whole, Germany succeeded in establishing various programs that led to economic development in Micronesia. However, because much of the German effort focused on Yap, the Marshall Islands, and the Northern Mariana Islands, development in Palau lagged slightly behind.

Japan had long shown an interest in Micronesia, its traders having established contact with several main islands during the late 19th century. When Germany became involved in World War I, Japan quickly occupied major islands throughout Micronesia. Japanese forces landed on Koror and Angaur in October 1914, with a garrison stationed at the latter a few months later (Office of the Chief of Naval Operations, 1944:25; Peattie, 1988:43). In 1920, the League of Nations recognized Japan's authority over the region with a Class C Mandate (Clyde, 1967). The Japanese period of administration was particularly active, as Palau's new rulers introduced economic development at a scale previously not seen (Useem, 1946:66). Palau became the administrative center of this effort, with the capital of the civilian administration established on Koror in 1922 (Office of the Chief of Naval Operations, 1944:26).

Japanese development schemes varied throughout Micronesia. In Palau the emergence of an administrative center was complemented by agricultural development (mainly on Babeldaob Island), mining (on Angaur Island), and some industry. Japan actively promoted migration (some of it through "black birding" — capturing natives from one island group and physically moving them to another group to work). Persons were moved to certain parts of Palau, both from elsewhere

---

in the Pacific (for instance, to provide labor in the Angaur mines) and from Okinawa and Japan. Moreover, the Japanese attempted to introduce various facets of their culture to Micronesia — including education and the Japanese language. Although Japanese efforts to develop Palau economically met with mixed success, once established as the administrative center of the Mandated Territory the town of Koror began to grow rapidly. Augmented by induced economic growth from the increased population that immigrated to support the center of government, by the mid-1930s Koror had become a busy, modern colonial town (Clyde, 1967, pp. 161-162; Peattie, 1988, pp. 174-176). The population had swelled due to the large number of immigrants. By the end of the 1930s, more than 24,000 immigrants resided in the Palau District of the Mandated Territory (Johannes, 1981:4; Quimby, 1988:125).

As the years of the Japanese administration wore on, development in Micronesia shifted from an emphasis on economic projects to military concerns. During the 1930s, the Japanese began to fortify several islands in the region, including parts of Palau. Despite having large, relatively flat areas that could have served as airfields, the main strategic value of Palau was its proximity to the Philippines (Peattie, 1988:232). Although the Japanese stationed a battalion-strength force on Palau in 1940, adding both an air flotilla and additional personnel in 1941 (Peattie, 1988, pp. 252, 344), the main military buildup occurred elsewhere in the Mandated Territory. Palau eventually became the focus of military conflict in 1944. American forces bombed Koror throughout summer of 1944, virtually destroying the town and forcing Japan to shift the Mandated Territory government to Babeldaob. U.S. Marines landed on Angaur and Peleliu islands in the fall of that same year, eventually defeating the Japanese on each after particularly costly battles (Peattie, 1988, pp. 291-297). By early 1945, Japanese forces on Palau had been defeated or successfully neutralized and bypassed by American forces on their way to the Philippines. The residents of Palau, who survived, both Japanese and native, faced a different challenge — the struggle to find adequate food for the duration of the war. By the time peace was declared in August 1945, more than 2,000 Japanese soldiers and civilians and untold numbers of natives had succumbed to starvation or disease (Peattie, 1988, pp. 300, 304).

The U.S. Navy administered Japan's former Micronesian possessions immediately following World War II. In 1947, the United Nations placed these islands in a strategic trusteeship called the Trust Territory of the Pacific Islands (TTPI), with the United States named as administrating authority (Shinn, 1984, pp. 303-305). In contrast to the Japanese administration, the TTPI phase of Palau's history saw much less active interest on the part of the new administrators. Except for minor efforts to provide essential infrastructure and selected social programs (e.g., education, basic health care), most development under the TTPI administration did not begin until funding increased during the early 1960s (Quimby, 1988, pp. 127-128). By 1979, several island groups chose to modify their political status: the Northern Mariana Islands became a U.S. commonwealth in the mid-1970s. Other groups became independent nations in 1979, with the Marshall Islands forming a republic of the same name and the Yap, Chuuk (Truk), Pohnpei (Ponape), and Kosrae (Kusaie) districts of the TTPI forming the Federated States of Micronesia (FSM). In contrast, while Palau formed a "republic" and began electing a local President and Congress (OEK), it maintained its affiliation with the U.S. as the TTPI. While the Marshall Islands and the FSM chose independence with a Compact of Free Association to define their respective relationships with the United States, Palau's citizens rejected the Compact due to provisions enabling the placement of U.S. nuclear weapons in Palauan territory (Quimby, 1988:110). Six special referendums failed to achieve the two-thirds majority necessary to ratify the Compact. As a result, the Republic of Palau remained the last island group within the TTPI, its political future currently uncertain. Finally, in November 1992, Palau's voters approved an amendment to the Constitution to permit a simple majority vote to ratify the Compact of Free Association with the United States. On October 1, 1994, Palau achieved her independence. Recently, we celebrated our 10<sup>th</sup> Anniversary of political independence.

## CHAPTER 2. DEMOGRAPHIC HISTORY

Chapter 1 presented a brief sketch of Palauan history. That overview emphasized the role of other countries in Palau's past — in part because much of what is known of the history of Palau concerns interaction with people from other nations, but primarily because of the many contacts over the past 250 years. This chapter focuses on demographic change to Palau's 2005 population and housing. Palau had nine censuses conducted between 1920 and 1973 — four by the Japanese government (in 1920, 1925, 1930, and 1935), three conducted by the Navy and the TTPI administration (in 1946, 1958 and 1973), one conducted by the Peace Corps in collaboration with the University of Hawaii School of Public Health (in 1967), and one conducted by the U.S. Bureau of Census (in 1970). A quick look at these censuses shows change in the number of people living in Palau, their geographic distribution among the 16 States, basic age and sex composition, and reasons for the changing number and geographical arrangement of people over time.

### The Pre-contact and Early Contact Population of Palau

The pre-contact population of Palau is not well documented. Estimates range from 20,000 to 50,000 inhabitants (Useem, 1946:63), but none are founded on good data. However, most researchers generally agree that the population of Palau prior to the beginning of prolonged contact with outsiders in the 1780s was substantially greater than that of the early 20th century when more reliable estimates became available (Krämer, 1919:292). The reasons for depopulation included warfare between chiefdoms on Babeldaob and neighboring islands during traditional times. The most likely cause of depopulation was diseases introduced by Europeans to people wholly unprepared biologically for these sicknesses. Smallpox, influenza, syphilis, and measles all probably contributed to the population decline in Palau (Hezel, 1983:291). By the 1860s the situation on Koror Island led a German resident to predict that the end was near for the entire civilization (Tetens, 1958:4).

Population figures for Palau in the late 1800s and early 1900s are more accurate, due to their foundation on systematic observations by the naturalist Kubary and attempts by the German government to develop accurate population estimates (Force and Force, 1972:4). German estimates for Palau were 3,748 in 1901, 4,321 in 1908, and 4,543 in 1914 (including 369 migrants from Pohnpei) on the eve of the Japanese occupation (Yanaiharu, 1967:42). The massive population decline experienced earlier clearly was over by the beginning of the twentieth century. So the population grew between 1901 and 1908, and subsequently declined slightly between 1908 and 1914.

### The Population of Palau During the Japanese Administration: 1920-1935

The Japanese South Seas Bureau [Nan'yo-cho] conducted its first census of Palau in 1920, recording a total of more than 5,750 Pacific Islander residents (Table 2.1 and Figure 2.1). The 1920 census combined the populations of many current states, recording separate figures for Angaur, Koror, and Peleliu.

Notes: Figures for 1920-1935 is for Pacific Islanders only; figures for 1920, 1946, 1967 and 1973 may not sum precisely to totals due to exclusion of individuals whose ages were "Not Stated"

The Pacific Islander population of Palau exceeded 6,000 in 1930, having grown at an average annual rate of only 0.2 percent since 1925. All but three states gained population between 1925 and 1930. Koror State once again contained the greatest number of inhabitants (Table 2.1). Population continued to be fairly concentrated in a few places, with Koror, Angaur, and Peleliu states together accounting for nearly 44 percent of the total in 1930. The age-sex composition of Palau remained similar to that recorded in 1925, although the population pyramids for these years are not readily comparable. Once again, the census counted more males than females.

By 1925 the Pacific Islander population of Palau increased to almost 6,000 persons, having grown at the modest average annual rate of 0.7 percent (Table 2.2). For the first time, the 1925 census recorded the population of each state in Palau. The population showed a slight drop in 1946, from 6,230 to 5,777 or about -0.7 percent. This maybe due to some US soldiers returning home after World War II. The population slowly started recording increases, recording slight percent changes in the subsequent censuses.

Table 2.2. Population Change Over Time: Selected Years

Selected Years	Number		Average Annual Change from Preceding Year in Percentages

Note: Total percent for 1967 & 1973 may not sum precisely to 100.0 percent due to exclusion of individuals whose residence was "Not Stated."

More than 21 percent of the total Pacific Islander residents lived in Koror, up from 17 percent in 1920 (Table 2.3). This state, chosen by the Japanese as the capital of the Mandated Territory, saw its population increase by more than 5 percent annually during the first half of the 1920s. In 1925, more than 13 percent of the Pacific Islanders in Palau resided in Angaur State and nearly 11 percent lived in Peleliu State.

The proportion of Palau's population living in Koror increased throughout the period, from 21 percent in 1925 to 60 percent in 1973. Angaur's and Peleliu's population decreased in each successive censuses, except in a few cases.

The 1930 census also presented the age-sex composition of Palau by state. Age composition varied considerably (Table 2.4). Koror, the state with the highest population, contained relatively more Pacific Islanders aged less than 25 years than did the republic as a whole — probably due to a combination of younger people migrating to the emerging Japanese town of Koror for schooling and jobs. Angaur State contained relatively few persons aged less than 15 years or more than 59 years, the population having more young and middle-aged adults, many probably working in the phosphate mines. The southwest islands contained very small percentages of persons aged 15 years or less.

Part of the growth in the number of Pacific Islanders in Palau between 1925 and 1930 occurred by natural increase — that is, an excess of births over deaths (Office of the Chief of Naval Operations, 1944:36).

However, data from the 1930 census show that

Table 2.5. Population of States by Area of Registration: 1930

migration also played a role in population growth in Palau. Data for place of registration provide important insights on lifetime migration (Table 2.5). Only about 57 percent of the islanders living in Palau in 1930 resided in their place of registration. The more than 31 percent who moved from elsewhere in Palau helped shape the geographic distribution of population as enumerated by the 1930 census. Finally, nearly 12 percent of the Pacific Islanders who lived in Palau in 1930 were registered elsewhere — about 10 percent in some other part of the Mandated Territory and another nearly 2 percent some place outside the Mandated Territory.

The parts of Palau with the largest percentages of immigrant Pacific Islander populations in 1930 included Angaur, Koror, and Ngatpang States. As discussed earlier, many people migrated to Angaur from elsewhere in the Pacific, often at the request of their Japanese administrators, to work in the phosphate mines. Growth in Koror, in turn, probably reflects an early phase of rural-urban migration in Palau, with people from more remote parts of the district relocating to Koror as the Japanese developed their new capital.

Between 1930 and 1935 the Pacific Islander population of Palau continued to grow slowly, the 0.7 percent average annual rate of increase producing a Pacific Islander population of 6,230 (Table 2.1). The relative importance of Koror State declined slightly over this five-year period, probably due to the influx of large numbers of Japanese nationals to the state dominating the competition for land and jobs. Nevertheless, Koror still contained nearly 20 percent of the Pacific Islander population of Palau, with about 12 percent each residing in Angaur and Peleliu states. The age and sex composition of Palau in 1935 was similar to that seen in 1930. Palau still contained more males than females, but for the second consecutive census the relative difference decreased.

Table 2.6. Population (Pacific Islanders) by State and Age: 1935

Source: Nan'yo-cho, 1937.

Individual states in Palau continued to show considerable variability in the age composition of their Pacific Islander populations (Table 2.6). Once again, Koror State contained relatively more persons aged less than 15 years than Palau as a whole. The trends in age composition for Angaur, Hatothobei, and Peleliu discussed for

1930 continued in 1935.

The limited vital statistics available for the early 1930s show that fertility continued to exceed mortality, once more leading to natural increase in the population (Office of the Chief of Naval Operations, 1944:36). Unfortunately, data on mobility were not reported for the 1935 census.

### The Population of Palau in 1946 and 1958

A military census in 1946 reported the total Pacific Islander population of Palau at 5,964 (Useem, 1946:63), as seen in Table 2.7. The census showed about equal numbers of males and females, and a relatively young population, with few elderly persons. By the time of this census, foreigners made up only 8 percent of the population – U.S. Navy personnel and other non-Palauans.

Table 2.7. Age, Sex, and Ethnicity, Palau: 1946

Age Group	Palau			Palauans			Non-Palauans		
	Total	Male	Female	Total	Male	Female	Total	Male	Female

Note: Zero year olds not shown; ages may be off by one year & Kayangel missing data

The office of the High Commissioner of the TTPI did not conduct a detailed post-war census of Palau until 1958. The total population of Palauans had increased to 8,884 persons over the preceding 23 years (Table 2.7a). Table 2.7 shows the 1958 population of all people residing in Palau, including non-Palauans.

The age-sex composition of Palau's population also changed dramatically over the 23 years preceding the 1958 census. In 1958, male Palauans reached 4,502 and 4,382 females (Figure 2.2). Moreover, young people had become increasingly important demographically — the median age estimated at 17.5 years. Palau's population became increasingly youthful. Additional, detailed, reliable data on other aspects of Palau's population are unavailable from the 1958 census. From the information at hand — rapid population growth and a population containing relatively many young persons — natural growth probably accounted for much of the population growth between 1935 and 1958.

Table 2.7a. Age by Place of Birth, Major Ethnic Group, and Sex, TTPI: 1958

### The Population of Palau in 1967

The population of Palau continued to grow at the end of the 1950s and into the following decade, reaching nearly 11,400 by 1967. Overall population growth occurred at more than 2 percent annually over the nine years following the 1958 census. The population of Koror grew even more rapidly — in excess of 5 percent annually — and as a result totaled nearly 5,700 persons in 1967, about half the total population. In total, Palau continued to contain more males than females, although the difference once again decreased between census years.

Although the age composition of individual states in Palau continued to vary for the 1967 census, this variability was considerably less than during the Japanese administration (Table 2.8 and Figure 2.3). Compared to Palau as a whole, Koror contained relatively fewer individuals younger than 15 years and older than 59 years — the heavy representation of working-age persons suggesting that migration for employment possibly led to much of the population growth experienced by this state between 1958 and 1967. Heavy under-representation of young persons (aged 24 years or less) continued in the Southwest Islands.

1970	11,210	336	30.0	145.2	5,222.9
1973	12,673	401	31.6	162.9	5,574.2

Sources: School of Public Health, n.d.; USBC, 1972; Census Coordinator, 1975; U.S. Dep't of State, 1981.

Available data on births show that fertility was relatively high in Palau in 1967 (Table 2.9). The general fertility rate reached 200 (see Chapter 6 for definitions and explanations of the rates) with the crude birth rate at 37 percent. The rates decreased to 163 and 32

respectively by 1973.

As with other characteristics, fertility varied considerably by state (Table 2.10). Koror, being the capital and economic center of Palau, had the largest population and total births. The crude birth rate was low because of this larger population compared to the number of births to women. The total fertility rates (TFR) are shown as either per 1,000 women – in this case 6,570 – or per woman, in this case, 6.57 children per woman. Because of small numbers, particularly when selected groups migrate from rural to urban areas, sometimes the rates become strange. The high TFRs for Hatothobei, Melekeok, and Ngaremlengui clearly show this phenomenon; these values should not be used.

Notes: "Births" based on infants in population aged one year or less, which differed from the data used in Table 2.8 (reported births) — explaining the discrepancies in the measures presented.

Mortality data for 1967 show that most Palauans died before age 5 (more than 26 percent of all reported deaths in 1967), or after the age of 69 (nearly 31 percent of the year's reported deaths) (Table 2.11-12). Infant mortality as well as the overall crude death rate was quite low (Table 2.11-12), although some caution is in order when considering these figures given the habitual underreporting of deaths throughout Micronesia. An excess of births over deaths probably accounted for most of the population growth in Palau between 1958 and 1967. Reliable data on mobility in Palau for 1967 are unavailable.

### The Population of Palau in 1970

In 1970 the U.S. Bureau of the Census conducted a census of each district in the TTPI, including Palau. We present the basic 1970 data in this report — the population counts and percentages of total counts for the various states of Palau (see tables 2.1 and 2.3) — for the sake of completeness. However, because the data are flawed we do not examine them further. Fertility data, although not weakened by a census undercount, yielded measures that are of questionable use for comparisons and trends (see Table 2.9).

### The Population of Palau in 1973

Because of the aforementioned weaknesses in the 1970 census, the TTPI administration decided to conduct another census in 1973. That census enumerated nearly 12,700 persons living in Palau, showing an average annual increase of about 2 percent over the six years between 1967 and 1973. Koror's population approached 7,700, as the percentage of the total population living there exceeded 60 percent for the first time. The predominance in the percentage of males over females increased slightly from that recorded in the 1967 census, as did the median age that increased to an estimated 18.8 years.

Data on the age composition of selected states once again show considerable variability, although much of this variation may relate to the small populations in some of the states (e.g., Hatohebei, Kayangel, and Sonsorol) (Table 2.13 and Figure 2.4). Koror contained relatively large numbers of individuals aged 15-59 years.

Figure 2.4: Age-Sex composition: 1973

Fertility decreased from almost 7 1/2 children per woman measured by the 1967 census and births during that year to about 5 1/2 children in 1973, a remarkable decrease of about 2 children per woman. Admittedly, we are dealing with very small numbers here, so rates need to be looked at over a longer term to see real trends. Recorded mortality was almost certainly too low. Natural increase once again accounted for most of the population growth between 1967 and 1973.

Table 2.14. Place of Usual Residence of TTPI-born Individuals by Home District: 1973

Available evidence suggests that mobility within Palau would have contributed substantially to the geographic distribution of population in 1973 (Table 2.14). More than 34 percent of the TTPI-born residents of Palau in 1973 considered “home” some district other than the one they

resided in at the time of the census. The vast majority of these individuals resided in Koror, suggesting that in-migration from other parts of the republic accounted for much of Koror's population increase. About 4 percent of the TTPI-born population of Palau in 1973 moved there from another part of the TTPI. Most of these individuals lived in Koror.

Complementary data on mobility of Palau-born individuals still residing in the TTPI in 1973 provide evidence for migration from many parts

Table 2.15. Area of Birth of TTPI-born Individuals by Place of Residence: 1973.

of Palau elsewhere in the republic, almost certainly Koror (Table 2.15). In comparison, relatively few individual born in Koror lived elsewhere in Palau — and the percentage reported may be inflated due to women from another part of Palau coming to the Koror hospital to give birth and subsequently returning home (the child thus born in Koror but living in another part of Palau). A full 8 percent of Palau-born individuals lived somewhere in the TTPI other than Palau in 1973, showing emigration seen much more in the 1990 census data (see Chapter 16).

*The 1980 Census.* The U.S. Census Bureau conducted a full census in Palau in 1980, the second one in the Decennial series (although, again, the results of the 1958 Census were used as proxy for the 1960 U.S. Census). The decline of 550 persons over the 7 years after the TTPI Census seen in Table 2.2 probably was an artifact of different collection procedures and the recent split up of the TTPI government into constituent parts. All but four of what would become Palau's States experienced depopulation during the period, although no decrease was very great. Koror increased to 63 percent of the total population.

The breakup of the TTPI government caused various types of migration – return from Saipan, but also outward movements, particularly for schooling, but also jobs, to a lesser extent. The 1980 Census for CNMI showed 735 Palauans residing there and 1,335 Palauans were reported as living on Guam. Amount 700 to 1000 Palauans resided in the United States, depending on how “Palauan” is defined.

*The 1986 Census.* The Palau Office of Planning and Statistics conducted a full census in 1986, with technical assistance from the United Nations Development Program. This census was the tenth in the series for Palau. That Census recorded 13,900 people, an average annual increase of 2.3 percent from 1980. Most of the States lost population between 1980 and 1986, as Koror became ever more attractive for its jobs. Data from this census appear in tables in the following chapters.

*The 1990 Census.* Because of Palau's continued political affiliation with the United States, the U.S. Bureau of the Census conducted a census of the republic in 1990. The Bureau conducted this census as part of the general decennial effort for the Pacific Islands, including American Samoa, Guam, and the Commonwealth of the Northern Mariana Islands (CNMI). Data collection, processing, and presentation were consistent with the decennial census for the United States and other U.S. territories. Data from the 1990 Census appear throughout the following chapters.

---

## 1995, 2000 and 2005 Republic of Palau Censuses of Population and Housing

### *Data Collection and Presentation*

The 1995, 2000 and 2005 Censuses were developed, executed, tabulated, and analyzed completely by personnel within the Republic of Palau's Office of Planning and Statistics, but with technical assistance from and procedures developed by the U.S. Census Bureau. The Republic of Palau used these conventions to obtain comparable information to the U.S. States and territories needed for U.S. Federal and other programs. Since these conventions do impinge on the usefulness of the data within Palau's ministries, agencies, and the private sector, they were followed whenever possible.

In accordance with normal U.S. Census Bureau practice, the 1995, 2000 and 2005 censuses of Palau enumerated each person according to his or her *usual residence*. The usual residence is the place where a person lives and sleeps, not necessarily the same as legal residence or voting residence. The application of this fundamental criterion resulted in the establishment of categories for certain persons enumerated by the census.

Because details of the enumeration and residence rules employed in the 1995, 2000 and 2005 censuses are published elsewhere (see 2005 Census Basic Tables appendices), this report presents only a brief summary. The 1995, 2000 and 2005 censuses collected data on each usual resident of the Republic of Palau, including those individuals who normally lived in the republic but were absent on Census Day. The census excluded those persons present in Palau but with a usual residence elsewhere. Individuals who had more than one residence were counted at the place they considered their usual residence. Individuals who had no usual residence were counted where they were staying on Census Day. The census enumerated persons away at school or in institutions at the locations of those places.

The 1995, 2000 and 2005 censuses of Palau employed a modified list-enumerate procedure, also known as door-to-door enumeration. Beginning in mid-March 2005, enumerators began visiting each housing unit and conducted personal interviews, recording the information collected on the single questionnaire that contained all census questions. Appendix B presents a facsimile of the questionnaire employed in the 2005 census of Palau. Follow-up enumerators visited all "addresses" without a returned questionnaire to obtain the information required for the census.

The OPS office staff checked all questionnaires for completeness and consistency of responses, and then began processing them. After checking in the questionnaires, OPS staff coded write-in responses (e.g., ethnicity or race, relationship, language). Then data entry clerks keyed all the questionnaire responses using the entry package of CPro (Census and Survey Processing system). The OPS brought the keyed data to the U.S. Census Bureau headquarters near Washington, DC, where OPS and Bureau staff edited the data using the Consistency and Correction (CONCOR) software package prior to generating tabulations using the Census Tabulation System (CENTS) package. Both packages were developed at the Census Bureau's International Programs Center (IPC) as part of the Integrated Microcomputer Processing System (IMPS).

### **Conclusions**

Population change in Palau generally has followed the same pattern seen elsewhere in the Pacific (Taeuber, 1963; see Gorenflo, 1990, 1992; Gorenflo and Levin 1991, 1992): an extended early period of depopulation following the establishment of contact with non-Palauans, producing a population much smaller than that preceding contact; and a subsequent period of population growth, established by the beginning of the 20<sup>th</sup> century and continuing over the decades. The main cause of depopulation was an increase in mortality, accompanied by reduced fertility. The demographic growth resulted from a reversal in these trends — with the number of persons born into the population each year significantly greater than the number that died.

Population growth continued through the early 1970s and, as we shall see in the next chapter, and through the 1990s. But this increase occurred at a rate much less than seen in most other parts of the Pacific. The more modest population growth seen in Palau in recent years is due partly to low fertility. This low fertility was augmented by emigration — removing people and, because of the young adults involved, further reducing fertility at the same time.

## CHAPTER 3. GEOGRAPHIC DISTRIBUTION

The geographic distribution of Palau's population has changed dramatically from pre-contact times when most people lived in small hamlets and villages along the coast of Babeldaob and smaller inhabited islands. During the 20th century, Palau's population became increasingly concentrated in Koror. Relocation of the capital to Melekeok, when finished and fully functional on Babeldaob, may change the distribution somewhat. The trends of population growth and concentration found in Palau are consistent with population trends found in other Pacific Island areas (see Chapter 8). This chapter discusses recent changes in overall population and its distribution in the Republic of Palau.

### Definitions

#### *Place of Residence*

The 1990, 1995, 2000 and 2005 censuses were all modified *de jure* censuses, counting people and recording selected characteristics of each individual according to his or her usual place of residence as of census day. Each census collected data for each enumeration district – the households and population in each enumerator assignment. These enumeration districts were then collected into hamlets in Koror, and the 16 States of Palau.

**Comparability.** All of the censuses between 1980 and 2005 censuses collected data on place of usual residence at the time of enumeration. Geographic compatibility is available at the Enumeration Districts' (ED) level for several of the censuses, and at the State level for all censuses.

### Analysis of Geographic Distribution Data

The population of Palau continued to grow over the decades preceding the 2005 census (Table 3.1 and Figure 3.1). The population increased 14 percent between 1980 and 1986 (a six year period) and 9 percent between 1986 and 1990 (a four year period). Once Palau went into a 5-year census cycle, starting with the 1990 Census, it became easier to see the population increase. From 1990 to 1995, the population increased from 15,122 to 17,225 (14 percent), and to 19,129 in 2000 (11 percent), but then, due to changing migration patterns, only increased slightly between 2000 and 2005. Throughout the period, Koror remained by far the largest state.

Despite a total 1990 population that was nearly 25 percent greater than that of 1980, 13 states in Palau lost population during that decade — their relative contribution to the total declining in the process. The two major exceptions to the trend for the 1980s were Koror and Airai states; both having experienced sustained population growth between 1980 and 1990. Between 1990 and 2000, the numbers living in Koror and Airai continued to increase, but while Koror remained at about 70 percent of the total population of Palau, Airai increased to more than 11 percent (from less than 6 percent in 1980).

By 2005, Koror had decreased to 64 percent of the population, while Airai increased to almost 14 percent, probably because of reduced non-Palauan numbers in Koror, and movement of Palauans because of the development of the Capital (Table 3.2 and Figure 3.2).

Koror State is the only urban place in Palau (with "urban" defined by the U.S. Bureau of the Census as places containing 2,500 persons or more).

Table 3.3. Population Change in Palau by State (Percentages): 1980-2005

phenomenon is occurring in many areas in the Pacific. These states contain the airport, the national government, and most of the businesses. No other areas are showing this kind of in-migration (Table 3.3).

Because of Palau's recent geographic patterns, population density in most states is quite low, including the outer islands with relatively little land area (Table 3.4). Koror is the exception, where population density approached 1,500 persons per square mile in 1990, more than 1,700 in 1995, almost 1,900 people in 2000 but decreasing slightly to 1,800 per square mile in 2005. By 2005, Airai had more than 150 persons per square mile, about the same as Peleliu, but still below the density on Kayangel. Changes in the population densities of other states were consistent with the shifts in the distribution of Palau's population over the past two decades.

Table 3.4. Population Density in Palau by State: 1980-2005

State	Land Area in Square Miles	Persons per Square Mile					
		2005	2000	1995	1990	1986	1980

Source: 1995, 2000 and 2005 Censuses, Table 24

Table 3.5 shows the population distribution of the 12 hamlets in Koror State for 1995, 2000 and 2005, and Figures 3.3 and 3.4 shows the number of people in 2005. Eang, which is part of Ngerkebesang, was separated due to its population's unique ethnicity. The people of Eang are from the Southwest Island states of Sonsorol and Hatohebei, and have "Carolinian" ethnicity. The population of Koror State increased by more than 1,000 persons between 1995 and 2000, but then decreased by about 600 in the next 5 years. In all three census years, Madalaii had the largest population, with more than 3,000 persons in 1995 and 2000, but only about 2,200 in 2005; while it looks like Madalaii had a large population decrease during the half-decade, group quarters were coded differently in 1995, so care should be used in analyzing the change between 1995, 2000 and 2005. As noted, the population continued to decline before the 2005 census. But even given these criteria, the proportion residing in Madalaii hamlet decreased from about 3 in 10 to about 1 in 6 during the 10 years.

Figure 3.3. Number of People by Hamlet, Koror: 2005

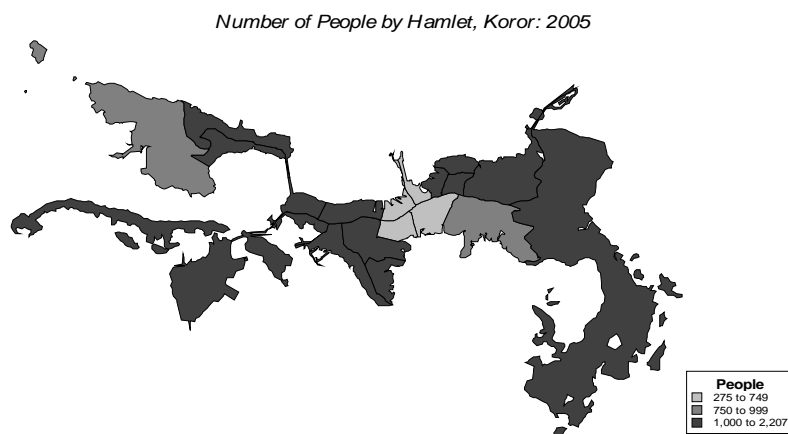

Figure 3.4. Population by Hamlets, Koror: 2005

Table 3.6 shows the numbers and percentage of ethnic Paluans in the Koror hamlets in 1995, 2000 and 2005. In 1995, about 7 in every 10 persons of the residents in Koror state were ethnic Palauan, but this decreased to about 2 in every 3 persons in 2000. The largest numbers of Paluans were living in Ngerbeched, Ngerchemai, and Madalaii in each census, but the order in 2005 was Ngerchemai, Madalaii,

Table 3.6. Paluans in Hamlets in Koror State by Population: 1995, 2000 and 2005

and then Ngerbeched. Eang was the biggest gainer during the decade, from 39 to 284 Palauans, while five of the hamlets lost population. About 83 percent of Ngerkesoal was Palauan, the largest percentage of any of the Hamlets. At the other end of the continuum, less than 60 percent of Ikellau and Madalaii were in this category.

Table 3.7 shows for Koror State in 1995, 2000 and 2005, the population living in the same house as 5 years before the census. About 54 percent of the population 5 years and over in Koror lived in the same house in 1990 as 1995 for the 1995 census, compared to 64 percent for the 2000

Source: 1995, 2000 and 2005 Censuses, Table 33

Table 3.8 shows legal residence in Koror State for persons 18 years and over for the Koror hamlets. Almost 3,000 persons living in Koror also voted in Koror, although the number decreased between 2000 and 2005. The percentage did not change very much during the 10-year period,

decreasing only slightly, from 31 percent in 1995 to 30 percent in 2000 and 2005. Hence, only about 3 in every 10 persons of voting age living in Koror State actually voted there. In 2005, persons living in Ngerkebesang were most likely to vote in Koror (about half), and about 2 in every 5 voters in Meyuns and Ngerkesoal. Only about 1 in every 8 voters living in Eang and 1 in 7 in Madalaii voted there in 2005.

This brief discussion shows a few of the differences in the data resulting from the 1995, 2000 and 2005 Palau Censuses for the Koror hamlets. The three Censuses are a rich source of available statistical information for the hamlets and enumeration districts in Koror state. We will show charts and maps of the various characteristics throughout this report, but reference should be made to the basic tables (Volume I of this report) for detailed information at the hamlet level. These data should be useful by the National, State, and private sector planners.

**Conclusions:** Koror and Airai states continue to be the largest states, although Koror showed decline between 2000 and 2005. Both states became increasingly important during the 1980s and 1990s as persons moved to these States, both from the other States and from other countries. As both the center of government activity, as well as having most modern key public services (e.g., Palau High School, Palau Community College, and the Palau National Hospital), Koror continued to attract in-migrants and immigrants into the early 2000s. Recently, government policy restricting immigration has had the effect of decreasing Koror's population. Recent growth in Airai State probably occurred largely because it is right next to Koror. When the capital moves to Melekeok State, the focus of population growth may change — or at least expand to include this third state, and perhaps, adjacent States as well. Unless the Palau government makes a concerted effort to decentralize development, these states will continue to host most government offices and private sector economic activity, and as a result continue to experience rapid growth than other parts of Palau.

## CHAPTER 4. AGE AND SEX

The age and sex composition of a population provides basic information necessary for planning, providing key indicators for social and economic characteristics. Age composition helps identify populations for schooling, employment, voting, and retirement. Sex distribution is important for social characteristics, trends in community structure, and the population's economic potential.

In Chapter 2 we discussed the historical demography of Palau, including age and sex distributions. Among the most important characteristics was an historic surplus of men, although this discrepancy decreased over time. Palau also saw the emergence of an increasingly youthful population. More recently, the population of Palau has been aging, partly because of reduced fertility (that we discuss in Chapter 6), partly as a result of even more drastic decreases in mortality (examined in Chapter 7), and partly because of the unusual migration patterns featuring large numbers of working age immigrants (discussed in Chapter 8). Recent fertility, mortality, and migration trends — the three main mechanisms by which a population changes over time — have shaped the age and sex composition of modern Palau.

### Data Description

#### *Age*

The 2005 census obtained information on age from answers to questionnaire item 5, asked of all persons. The age classification considered the age of each person in complete years as of April 1, 2005. Normally the census used the age response in question 5 for the person's age on the reference date. When this response was unacceptable or unavailable, the census derived a person's age from an acceptable birth date response in question 5.

The Republic of Palau Office of Planning and Statistics uses data on age to determine the applicability of other questions for an individual and to classify other characteristics in census tabulations. Because of the important role played by age data in interpreting most social and economic characteristics, the office tabulates age by single years and by many different groupings.

One of the most important measures derived from data on age is *median age*. This measure divides the age distribution into two equal parts, one-half of the persons younger than the median age and the other half older. In most cases, computing median age employs more detailed age intervals than are shown in census publications. A median based on less detailed data may differ slightly from a corresponding median for the same population based on a more detailed distribution.

Limitations. For census collected and processed by the Republic of Palau, birth date takes precedence over age, and since most people know their ages, limitations in use of age data are minimized. When discrepancies occurred, a sophisticated computer edit procedure obtained the best fit for data within and between data records.

Comparability. Every census in the Republic of Palau collects age data. Because this information is so important to a census, in cases where age was not reported, and clearly appeared to be incorrect, the Census Bureau, and the Republic of Palau employed a procedure called *imputation* to assign ages. This procedure has been used for census data from Palau since 1970. The specific techniques for imputing age have differed in each census, introducing a problem of comparability between censuses (see U.S. Bureau of the Census, 1992c, Appendix B for more information on imputation).

#### *Sex*

The 2005 census obtained data on sex from answers to questionnaire item 2, asked of all persons. In most cases when sex was not reported, census personnel determined it by the appropriate entry from the person's given name and household relationship. Otherwise, sex was imputed according to the relationship to the householder and the age and marital status of the person (see U.S. Bureau of the Census, 1992c, Appendix B for more information on imputation).

Comparability. Every Republic of Palau census has included a question on sex, asked of all respondents.

## Analysis of Age and Sex Data

### Age and Sex Distribution

As Palau's population increased in recent years, it has also aged. The trend towards greater aging began between 1967 and 1973, as discussed in Chapter 2, reversing the early post-World War II trend for an increasingly young Palau population. Recent censuses of Palau reveal that the resident population has continued to age. The median age in 2005 was more than 32 years, an increase of 1½ years since 2000, and continuing the trend upward since 1980 (Table 4.1), an increase of nearly 7 years during the 1980s (Figures 4.1 to 4.4). The reasons for the increase in the median age of Palau's population include relatively low fertility, relatively low mortality into old age, and recent migration trends with a youthful emigrant population replaced (in part) by an older immigrant population.

Figure 4.1. Age Groups, Counts: 1980 to 2005

Figure 4.3. Median Age, Palau: 1980 to 2005

Figure 4.2. Age Groups (%): 1980 to 2005

Figure 4.4. Percent 65 years and over: 1980 to 2005

Data on the percentage of Palau's population in 5-year age groups show a steady reduction of those aged less than 15 years between 1980 and 2000 (Table 4.1a and Figure 4.5). The percentage less than 10 continued to decrease between 2000 and 2005, but the percentage in the 10 to 14 year old group increased slightly. In contrast, the proportion of the republic's population in older age groups tended to increase over the same period; particularly those individuals aged 25 to 54 years.

Figure 4.5. Population Pyramids, Palau: 1980 and 1986

Males showed the same change in median ages as the total population. In 1980, the median age of males was only 18.8 years, meaning that half the males were younger than 18.8 years old and half were older (Table 4.2). By 1990, the median age of males had increased to 26.1 years, exceeding the median for females by one year. The 1995 median for males was 28.4 years, an increase of more than 2 years during that 5-year period (Figure 4.6). The increase continued in the 2000 census, when the median for males was 31.3, an increase of another 3 years during the 5-year period, and a total increase of 5 years during the decade of the 1990s. By 2005, the male median had increased by another year to 32.5 years, while the female median decreased slightly (Figure 4.7). The male median age probably was greater than the female median because of the selective emigration of younger Palauan males and the selective immigration of working age, often unmarried, non-Palauan males.

The selective emigration of younger Palauan males and the selective immigration of working age, often unmarried, non-Palauan males.

Figure 4.6. Population Pyramids, 1990 and 1995

Figure 4.7. Population Pyramids, 2000 and 2005

The distribution of ages among males shows the same trends as for the population as a whole — that is, the number of younger males decreased as a percentage of the total male population while the proportion of older males increased. Males aged 0 to 19 years comprised 53 percent of the total male population in 1980, decreasing to only 39 percent in 1990, 35 percent in 1995, 30 percent in 2000, and 30 percent in 2005. Conversely, males aged 25 to 54 years increased from 27 percent to 42 percent of the total male population during the 1980 to 1990 decade, to 54 percent by 2000, and 53 percent in 2005.

The female median age increased from 18.9 years to 25.1 years between 1980 and 1990, then to 27.3 in 1995, 30.3 years in 2000, but then continued at 30.2 years in 2005 (Table 4.2). Although the median age for females was about the same as the median for males in 1980, by 1990 and onward, the median age for males was one year older than the median age for females — once again due primarily to selective migration. The same changes in relative importance of various age groups occurred for the females as for both the total population and for males, although the shifts were slightly less pronounced.

Table 4.3. Population by State in 15 Years Age Groups: 2005

Source: OPS, 2005 Census, Table 6

The age composition of various states in Palau varied substantially in 2005, in part due to various socioeconomic conditions guiding migration patterns and in part because of the small populations residing in certain rural states (Table 4.3). Ngchesar at 36.5 years had the highest median age, followed by Ngarchelong (36.1 years), and Ngardmau (35.8 years), Angaur and Melekeok (both 35.3 years). Figure 4.8 and 4.10 shows the percentage of persons aged less than 18 years old by state, and Figure 4.9 and 4.11 the percent of persons aged less than 18 years old for Koror only.

Figure 4.8. Percent Less than 18 Years Old by State: 2005

Figure 4.9. Percent Less than 18 Years, Koror: 2005

Figure 4.10. Percent Less than 18 Years by State: 2005

Percent Less than 18 Years Old by State: 2005

Figure 4.11. Percent Less than 18 Years, Koror: 2005

Percent Less than 18 Years by Hamlet, Koror: 2005

Koror, with more than two-thirds of Palau's population, influenced the median age of the entire republic. Koror's median age of 31.6 years was slightly above average for all of Palau, unlike in previous years, when it was clear that working-age immigrants pulled this measure up since they tended to live near their work in the urban center.

The percentage of persons aged less than 18 years also was slightly less in Koror than in the republic as a whole, although not all the states. Some rural states had higher median ages than the Palau median, partially due to larger proportions of elderly residents (those aged 65 years and over). Other rural states contained high percentages of both elderly and young persons. For example, about 40 percent of the population of Ngaraard and Ngatpang was less than 18 years only in 2005. More than 12 percent of Kayangel's population was aged 65 years or more, as was more than 11 percent of Ngiwal's. This situation is similar to a phenomenon occurring in rural settings throughout the Pacific, where very young people are left with older people while the parents of the former migrate elsewhere for work (See Figures 4.12, 4.13, 4.14 and 4.15).

Figure 4.12. Percent 65 years and over, Palau: 2005

Figure 4.13. Percent 65 years and over, Koror: 2005

Figure 4.14. Percent 65 years and Older, Palau: 2005

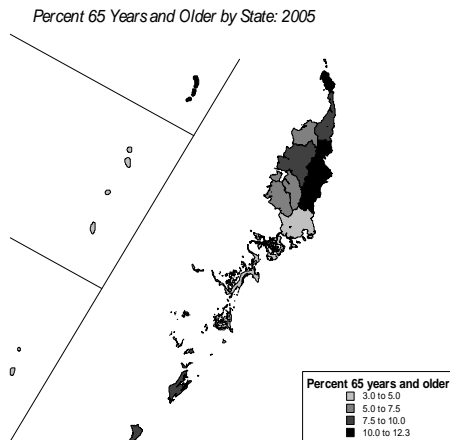

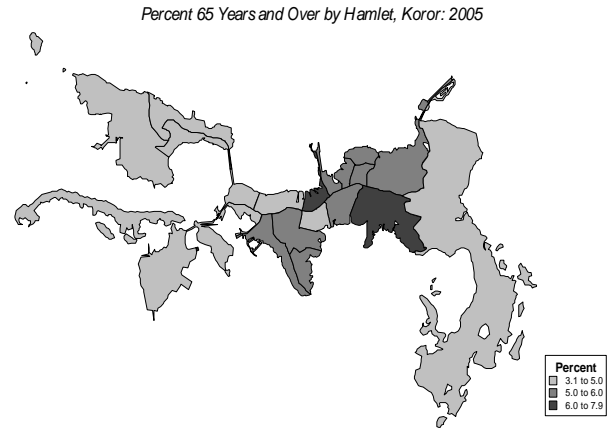

Figure 4.15. Percent 65 Years and Over, Koror: 2005

Characteristics of the geographic distribution of male residents of Palau were similar to those for the entire population (Table 4.4 and Figure 4.16). The median ages of males residing in Airai and Koror states were similar to the median for all male residents of the republic, with the former slightly younger and the latter slightly older. The age composition of other states in Palau varied, often considerably — once again, probably in part due to the variability one would expect in the small populations present in many of the more rural states. Hatohobei, Ngaremlengui, and Aimeliik all had male populations with median ages less than 30 years old.

Table 4.4. Male Population by State in 15 Years Age Groups: 2005

Figure 4.16. Median Age for Palau and Koror: 2005

Table 4.5 presents data on population by age and state of residence for females enumerated in the 2005 census. Apart from the geographic variability found in the last two tables, a relatively large proportion of females aged less than 15 years lived in rural areas in 2005. This trend primarily is a result of adult females relocating to urban areas, either to seek employment or further education or to accompany their husbands who migrated to urban places. The presence of younger female populations in rural settings probably also reflects a greater tendency for females to remain behind while males show a greater propensity for rural-urban mobility for work. The median ages of females in Ngaraard and Hatohobei states were particularly young compared to the entire republic – although the absolute numbers were also very small. (Ngaraard's female population skewed young because of Bethania High School – an all-female high school in the State). In contrast, several states had female median ages above 35 years. See Figure 4.16.

Table 4.6 presents data on change by age group from four recent censuses of Palau. The general trend was for numbers of younger persons to decrease while older persons increased. The data generally show continued decreasing fertility over the period as more women enter the labor force and delay or

forego children. Immigration and emigration as well as out- and in-migration of Palauans affect the population structure. The causes of these age-specific changes during the 1980s and 1990s probably were a combination of migration patterns and decreased fertility (see Levin and Retherford, 1986), as discussed further in chapters 6 and 8.

Male residents of Palau experienced changes by age during the 1990s and 2000s similar to those seen in the entire population (Table 4.7). Numbers of males in age groups younger than 20 years decreased during the period. The many male migrants influenced the population structure, making the traditional “pyramid” untenable. The trends continued through the 1990s and into the early 2000s.

Sources: 1992c, Table 6; OPS, 1995, 2000 and 2005 Censuses, Table 6

Females showed similar patterns to males, although with much less migration influencing the age structure (Table 4.8). Unlike in Guam and the CNMI, garment factories never really were a part of the migration mix. Females in most of the youngest five-year age groups considered in this

study tended to decrease during the whole period, but by amounts much less than those witnessed among males. Similarly, although the number of females in older age groups increased during the decades, this trend varied, with some remaining constant or even losing population. Again, the general upward trend for females continued throughout the 1990s and early 2000s.

Changes in the median age of Palau over the past decades varied both geographically and by sex (Table 4.9). The population of the republic aged markedly during the 1980s and 1990s, more among males than females. In general, persons in rural states were younger than those in urban states. This aging comes from the important role migration patterns play in shaping Palau's population distribution. Many working-age persons migrate to urban areas both from rural areas of Palau and from other countries. Peleliu State provides an interesting exception to this general trend. Peleliu shifted from a relatively young population in 1980 to a relatively old population by 1990, probably because of migration for schooling as well as Peleliu's position as neither urban nor rural (thus enabling it to retain both persons of working age and provide a comfortable setting for older, more traditional individuals). After 1990, however, Peleliu's population remained relatively younger than the other States.

Source: USBC, 1983, Table 16; 1992c, Table 6; OPS, 1987, Table A1, 1995, 2000 &amp; 2005, Table 6.

In 2005, the median age for males (32.5) continued to be greater than that of females (32.0). In 2005, the median ages of both sexes in Koror were the same, at 31.6, while the median age of males was greater than that of the females in Airai, but less in

Peleliu and the other States. For Koror and Airai, the median ages of both sexes increased throughout the period, with males older than females until 2005 for Koror, and with generally higher levels in Airai than Koror (See distribution, Figure 4.17). In 1990 and 2000, the median age of males was greater than the median age of females in Koror, Airai, and Peleliu states, representing a change over the preceding years. In 1986, the median age of females was greater than the median age of males in Palau, and in Koror and Peleliu states. The median age of females exceeded that of males in Palau and the states in Table 4.9 in 1980 as well. The change in Koror State during the 1980s from a female older population to a male older population probably was due to selective migration by age and sex, including the immigration of working age males. One may offer a similar explanation for the change documented in the other, mostly rural states — most notably as increased migration to Koror State by college and other working age males. The change seen in Peleliu State is not so easily explained, unless young females from that state are more likely to leave for schooling and jobs than young males.

Figure 4.17. Median Age, Palau and Koror: 2005

### Age and Sex Ratios

Ratios permit comparisons of phenomena over time and between countries and areas. Analyses of age and sex data often require examining large data sets. We can better discuss the complexities of changing age and sex compositions by using ratios. Here we employ two measures — the *sex ratio* and the *dependency ratio*. The former measures the number of males per 100 females, the latter the number of young (less than 15 years of age) and old (65 years of age or older) persons per 100 individuals of working age (aged 15-64 years).<sup>3</sup>

**Sex ratio.** In most populations, more males than females are born. However, because male mortality traditionally is higher than female mortality most populations contain more females than males, particularly among older age groups. These general tendencies hold for Palau, although the situation has changed markedly over the past decades (Table 4.10). For all census years examined, Palau contained more males than females — the ratio increasing over time, except for a slight dip in 1995, partly due to the selective immigration of working age males from outside, and in 2005, when the rate decreased to 116 males for every 100 females (Figure 4.18 and 4.19). Evidence for migration appears in the 1980 data, with excesses of males over females aged 15 through 34 years. This trend increased over time; by 2005, the age groups in which males substantially exceeded females expanded to encompass most 5 year age groups between 15 and 59 years of age, with ratios among the five-year age groups between 25 and 44 years particularly high. The 2005 data showed an opposite trend, though, for the population 15 to 19 years, with only 95 males for every 100 females, indicating male out migration for military, schooling, and jobs.

Table 4.10. Males per 100 Females by Age: 1980-2005

<sup>3</sup> Here we use "Males per 100 females" and "Sex ratio" interchangeably.

Figure 4.18. Males Per 100 Females for Palau, 18 Years and Over and Koror: 2005

Sex ratios varied among states in Palau (Table 4.11 and Figure 4.19). As with most of the demographic measures, the small populations of certain states give sex ratios that are not particularly informative. But for most states, sex ratios provide useful insights. With the exception of Ngerchelongs, Hatohobei and Sonsorol states, the sex ratio of each state exceeded 100. For Palau, each age group contained more males than females except the group of persons 65 years and older. The geographic variability present in most demographic measures emerged in sex ratios as well. As one might expect, the relatively large population of Koror State resulted in generally close agreement between the age-specific sex ratios here and the whole republic. Koror State had sex ratios in excess of 116 for the three working age groups in Table 4.11, although the values for two of these groups (15-24 and 25-44 years) were lower than those for the entire republic. The sex ratios for Airai, the second most populated state, were much higher than those for Koror.

Table 4.11. Males Per 100 Females by Age &amp; State: 2005

Source: OPS, 2005 Census, Table 6.

Sex ratios for rural states in Palau were both more variable and more difficult to explain. Males younger than 15 years were over-represented in several rural states — including those whose relatively large populations would prohibit widely fluctuating figures. The 15-24 year age group showed even more diversity, most overwhelming male but a few being more female. These age groups might show emigration for schooling and entry-level labor force participation, as well as children accompanying parents who moved for work or schooling. Finally, several rural states had more older males than females.

Figure 4.19. Sex Ratio for People 18 Years and Over for Palau and Koror State: 2005

*Sex Ratio for People 18 years and over: 2005*

*Males per 100 Females, 18 years and over, by Hamlet, Koror: 2005*

The *dependency ratio* in 2005 for Palau was 42.5 — meaning, generally, that Palau had only 42.5 young and old “consumers” for every 100 individuals of working age (Table 4.12 and Figure 4.20). The dependency ratio decreased continuously throughout the 1980s and 1990s, as the proportion of working age individuals increased, but increased very slightly between 2000 and 2005. The dependency ratios for both males and females also decreased over the decade, the change for males being stronger. The ratio for both sexes increased between 2000 and 2005. The dependency ratios by sex are for illustrative purposes, since males do not provide exclusively for males nor do females provide exclusively for females.

Figure 4.20. Dependency Ratio, Palau: 1980 to 2005

Most parts of Palau experienced changes in dependency similar to those for all of Palau. Reductions in total, male, and female dependency ratios were particularly pronounced in Koror State, with the ratio for males falling to 37 in 2000, but back up to 39 in 2005. Decreases in dependency ratios in Airai State similarly were dramatic, providing the greatest relative changes over the 1980s and 1990s, and continued to decline to 31 in 2005. Even the rural areas, subsumed under "other" in this table,

experienced declines in dependency between 1980 and 2005, and their declines continued as measured by the 2005 census. All of the rates are fairly low by world standards.

#### Accuracy Analysis of Age and Sex Data

The pyramid (Figure 4.21) showing the 1980 and 2005 populations by age and sex displays the effects of the incredible immigration of foreigners in recent years. The 1980 pyramid would be “regular” for a Pacific Islands population at the time, with recent, decreased mortality seen in the lower ages, and a continuing decrease with age for the older age groups. The 2005 population, however, shows the 25 to 40 year age groups as largest, for males and females, a pattern of more-than-modest net immigration.

Evaluating the accuracy of age and sex data collected in a census includes analysis by single years of age and multi-year age groups. For Palau, single years were used to determine whether the age reporting was affected by digit preference. In some populations, more people are reported than expected in ages ending on zero and five because of a greater tendency for people to use these digits — in effect rounding to the nearest five or 10 years. Whipple, Myers, Bachi, Carrier, and Ramachandran have developed indices for analyzing preference for certain digits (U.S. Bureau of the Census, 1971). We used the Census Bureau’s Population Analysis Spreadsheet (PAS) called SINGAGE to calculate Whipple’s, Myers’, and Bachi’s indices, all of which measure preference in digit reporting.

Table 4.13. Whipple’s Method of Digit Preference: 1980-2005

Census Year	Total	Males	Females
2005	1.02	0.98	1.07
2000	1.03	1.06	1.00
1995	1.04	1.06	1.02
1990	1.10	1.07	1.15
1980	1.06	1.08	1.04

Sources: USBC, 1983, Table 16; 1993b, Table 8.

Note: Whipple’s method uses ages 23 to 62 only.

Whipple’s index detects a preference for ages ending in zero, five, or both. If age reporting is consistent, this index should fluctuate slightly around one. The higher the value of the index, the higher the preference for digits zero and five. The Whipple Index for both sexes in 2005 was 1.02, indicating accurate reporting, and continuing a very slight downward trend from previous censuses (Table 4.13). Whipple’s Index calculations for the

Table 4.12. Dependency Ratio by Sex: 1990-2005

Year and Sex	Total	Koror	Airai	Peleliu	Other

Note: Dependency ratio =  $[(P0-14 + P65+) / P15-64] \times 100$ , where

P0-14 is the number of persons aged 0-14 years,

P65+ is the number of persons aged 65 years and older, and

P15-64 is the number of persons aged 15-64 years.

Figure 4.21 Pyramid: Population by Age and Sex, Palau: 1980 and 2005

series greater accuracy in age reporting in recent censuses. An explanation to the changes in index values during the 1980s is not obvious, although it is possible that some of the large number of immigrants to Palau during that decade did not know their ages precisely — as a result rounding their ages to five or 10.

The Myers (1940) and Bachi (1951, 1953) indices are similar to one another; although the magnitude of the former is almost double that of the latter. Both indices measure the excess or deficit of persons reporting ages ending in any of the

Note: The index for Myers method is the sum of the absolute values of the deviations; for the Bachi Method, the index is the sum of the positive deviations (1/2 the sum of the absolute deviations).

10 digits, expressing these deviations as percentages. The larger the value of either index, the greater the preference for certain digits. Values close to zero show accurate age reporting in censuses. Both indices show that age one is most aberrant (in a negative direction), followed by age five (positive) and age nine (negative), the last two especially for females (Table 4.14 and 4.14a).

In evaluating the quality of age and sex data from the 2005 census, we also calculated United Nations age-sex ratio scores, sex ratio scores, and age-sex accuracy indices (United Nations, 1952). All of these measures are very low, indicating accurate age and sex reporting. United Nations scores are compared to a large group of nations — hence; these values are "very low" compared to this large group of countries.

Table 4.15. Population, by Age and Sex, and United Nations Age-Sex Accuracy: 2005

5-Year Age Groups	Population		Age ratio		Age Ratio deviation		Sex ratio (Males per 100 Females)
	Male	Female	Male	Female	Male	Female

Source: Population Analysis Spreadsheets

Table 4.15 shows results of use of the Population Analysis Spreadsheet for age and sex analysis. As noted, Palau had about 116 males for every 100 females in 2000. Except for the oldest ages, more males than females were present at each 5-year age group. The age-sex accuracy index was 52.1, indicating good reporting, particularly considering the large amount of migration.

## Conclusions

The age and sex composition of Palau changed substantially between 1980 and 2005. Shifts in the age and sex structure of the Palau population have important implications for future planning, as well as for the future population structure of Palau.

Palau's population aged over recent decades, the median age surpassed 30 years in 2000, an increase of more than 50 percent in the previous 25 years. This increase came almost certainly from the combination of decreased fertility, continued low mortality, and selective migration. Lower fertility reduced births, the low mortality increased the number of older persons surviving, and the migration introduced more working age residents from other countries (primarily Asia). These trends were particularly marked in Koror State, the main destination for the immigrants as well as from rural states in Palau. Conversely, the populations of many of the rural states tended to be younger than all Palau.

As the population of Palau has become older, it has also continued to be skewed male, mainly because of selective migration. This trend started earlier in the 20<sup>th</sup> century, although the increases seen during the 1980s and 1990s countered the growing numerical importance of females through the late 1960s. As with the aging of Palau's population, the relative importance of males was seen in the increased sex ratio, reaching more than 120 in 2000, and 116 in 2005. The most obvious explanation for these changes is selective immigration, with male immigrants looking for jobs

influencing both the sex ratio and the age structure. Internal differences in sex composition roughly paralleled differences in age composition, with the populations of rural states tending to be younger than those of urban states.

---

## CHAPTER 5. HOUSEHOLDS, FAMILIES, AND MARITAL STATUS

For many years, extended family households consisting of a householder, with a spouse, children, parents, grandparents, grandchildren, siblings, and other relatives were the norm in the Republic of Palau. By the 2005 Census, extended families had become somewhat less common, as fertility and family sizes decreased, more people became employed in the cash (rather than subsistence) economy, and increasing numbers of immigrants arrived with different family structures. Demographic changes and socioeconomic shifts affect changes in household and family structure.

Marriage patterns influence other socio-cultural patterns. As a society becomes less traditional through prolonged acculturation, marriage patterns change — frequently leading to later age at marriage. Later marriage leads to decreases in total fertility. A strong relationship exists between age at first marriage and the number of children a woman has, partly because earlier marriage gives more time for births, partly because younger women are more fertile than older women.

### Definitions

#### *HOUSEHOLD TYPE AND RELATIONSHIP*

A *Household* includes all the persons who occupy a housing unit. A housing unit is a house, apartment, mobile home, group of rooms, or single room that is occupied (or, if vacant, intended for occupancy) as a separate living quarters. Separate living quarters are those in which the occupants live and eat separately from any other persons in the building and who have direct access from the outside of the building or through a common hall. Occupants may be a single family, one person living alone, two or more families living together, or any other group of related or unrelated persons who share living arrangements. The count of households or householders always equals the count of occupied housing units.

*Persons per household* is obtained by dividing the number of persons in households by the number of households (or householders). In cases where persons in households are cross-classified by ethnic origin or race, persons in the household are classified by the ethnic origin or race of the householder rather than the ethnic origin or race of each individual.

*Relationship to householder* data were derived from questionnaire item 3, asked of all persons.

- *Householder* — the person (or one of the persons) in whose name the home is owned, being bought, or rented and who is listed as person 1 on the census questionnaire. If there is no person like this in the household, any adult household member 15 years old and over can be designated as the householder. Households are classified by type according to the sex of the householder and the presence of relatives to the householder. The census distinguished two types of householders: a "family householder" and a "non-family householder." A family householder is a householder living with one or more persons related to the householder by birth, marriage, or adoption. The householder and all persons in the household related to him or her are family members. A non-family householder is a householder living alone or with non-relatives.
- *Spouse* — a person married to and living with a householder. This category includes persons in formal marriages, as well as persons in common-law marriages. The number of spouses is equal to the number of "married-couple families" or "married-couple households." The number of spouses, however, generally is less than half the number of married persons with spouse present, since more than one married couple can live in a household but only spouses of householders are specifically identified as spouse. The number of married persons with spouse present includes married-couple subfamilies and married-couple families.
- *Child* — sons or daughters by birth, stepchildren, or adopted children of the householder, regardless of the child's age or marital status. The category excludes sons-in-law, daughters-in-law, and foster children.
  - *Natural-Born or adopted son/daughter* — a son or daughter of the householder by birth, regardless of the age of the child. This category also includes sons or daughters of the householder by legal adoption, regardless of the age of the child. If a householder has legally adopted a stepson or stepdaughter, the child still is classified as a stepchild.

- 
- *Stepson/stepdaughter* — a son or daughter of the householder through marriage but not by birth, regardless of the age of the child. If the householder has legally adopted a stepson or stepdaughter, the child is still classified as a stepchild.
  - *Own child* — a never married child under 18 years who is a son or daughter by birth, a stepchild, or an adopted child of the householder. In certain tabulations, own child are further classified as living with two parents or with one parent only. Own children of the householder living with two parents by definition are found only in married-couple families. In a subfamily, an own child is a never-married child under 18 years of age who is a son, daughter, stepchild, or an adopted child of a mother in a mother-child subfamily, or either spouse in a married-couple subfamily.
  - *Related children* — own children and all other persons under 18 years of age in the household, regardless of marital status, who are related to the householder (except the spouse of the householder). Foster children are not included since they are not related to the householder.

#### *Other Relatives*

- *Grandchild* — the grandson or granddaughter of the householder.
- *Brother/sister* — the brother or sister of the householder, including stepbrothers, stepsisters, and brothers and sisters by adoption. Brothers-in-law and sisters-in-law are included in the "other relative" category on the questionnaire.
- *Parent* — the father or mother of the householder, including a stepparent or adoptive parent. Fathers-in-law and mothers-in-law are included in the "other relative" category on the questionnaire.
- *Other relatives* — anyone not listed in a reported category above who is related to the householder by birth, marriage, or adoption (brother-in-law, grandparent, nephew, aunt, mother-in-law, daughter-in-law, cousin, and so forth).
- *Non-relatives* — any household member, including foster children, not related to the householder by birth, marriage, or adoption. The following categories may be presented in more detailed tabulations: roomer, boarder, or foster child; housemate or roommate; unmarried partner; and other non-relatives.

When relationship was not reported for an individual, it was imputed according to the responses for age, sex, and marital status for that person while maintaining consistency with responses for other individuals in the household.

*Unrelated individuals* can comprise a householder living alone or with non-relatives only, a household member who is not related to the householder, or a person living in group quarters who is not an inmate of an institution.

*Family type* classifies each family — a householder and one or more other persons living in the same household who are related to the householder by birth, marriage, or adoption. All persons in a household who are related to the householder comprise members of his or her family. A household can contain only one family for purposes of census tabulations. Not all households contain families since a household may comprise a group of unrelated persons or one person living alone. Families are classified by type as either a "married-couple family" or "other family" according to the sex of the householder and the presence of relatives. The data on family type are based on answers to questions on sex and relationship.

- *Married-couple family* — a family in which the householder and his or her spouse are enumerated as members of the same household.
- *Other family*:
  - Male householder, no wife present — a family with a male householder and no spouse of householder present.
  - Female householder, no husband present — a family with a female householder and no spouse of householder present.

*Persons per family* is a measure obtained by dividing the number of persons in families by the total number of families (or family householders). In cases where the measure "persons in family" or "persons per family" are cross-tabulated by

ethnic origin or race, the ethnic origin or race refers to the householder rather than the ethnic origin or race of each individual.

*Subfamily* is a married couple (husband and wife enumerated as members of the same household) with or without never-married children under 18 years old, or one parent with one or more never-married children under 18 years old, living in a household and related to, but not including, either the householder or the householder's spouse. The number of subfamilies is not included in the count of families, since subfamily members are counted as part of the householder's family. Subfamilies were defined during processing of sample data. In selected tabulations, subfamilies were further classified by type: married-couple subfamilies, with or without own children; mother-child subfamilies; and father-child subfamilies. Lone parents include people maintaining either one-parent families or one-parent subfamilies. Married couples include husbands and wives in both married-couple families and married-couple subfamilies.

*Unmarried-couple household* is a household composed of two unrelated adults of the opposite sex (one of whom is the householder) who share a housing unit with or without the presence of children under 15 years old.

*Foster children* are non-relatives of the householder and are included in the category "roomer, boarder, or foster child" on the questionnaire. Foster children are identified as persons under 18 years old and living in households that have no non-relatives 18 years old and over (who might be parents of the non-relatives under 18 years old).

*Stepfamily* is a "married-couple family" with at least one stepchild of the householder present, where the householder is the husband.

Limitations. There are no systematic errors apparent in the data collected by the 2005 census of Palau on household type and relationship.

Comparability. The 2005 definition of a household is the same as that used in 1980, 1990, 1995, and 2000. The 1980 relationship category "son/daughter" was replaced by two categories, "natural-born or adopted son/daughter" and "stepson/stepdaughter." "Grandchild" was added as a separate category. The 1980 non-relative categories: "roomer, boarder" and "roommate" were replaced by the categories "roomer, boarder, or foster child," "housemate, roommate," and "unmarried partner."

## GROUP QUARTERS

The Republic of Palau Office of Planning and Statistics, like the Census Bureau, classifies all persons not living in households as living in group-quarters. The OPS recognizes two general categories of persons in group-quarters:

- (1) institutionalized persons, and
- (2) other persons in group quarters (also referred to as "non-institutional group quarters"). Group quarters do not yet play a particularly important role in Palau.

Institutionalized persons include persons under formally authorized, supervised care or custody in institutions at the time of enumeration. These persons are classified as patients or inmates of an institution regardless of the availability of nursing or medical care, length of stay, or number of persons in the institution. Generally, institutionalized persons are restricted to the institution buildings or grounds (or must have passes or escorts to leave) and thus have limited interaction with the surrounding community. Also, institutionalized persons generally are under the care of trained staff having responsibility for their safekeeping and supervision. Details on various types of institutions appear in the definitions section of the 2005 Republic of Palau Census of Population and Housing cross-tabulations.

Other persons in group quarters include those who live in group quarters other than institutions. Persons who live in rooming houses, group homes (homes for the mentally ill, mentally retarded, physically handicapped, abusers of drug or alcohol, and other group homes), and religious group quarters are classified as other persons in group quarters when there are 10 or more unrelated persons living in the unit; otherwise, these living quarters are classified as housing units. Persons living in college dormitories, agricultural workers' dormitories, other workers' dormitories, and emergency shelters for homeless persons are classified as living in group quarters regardless of the number of inhabitants, as are crews of maritime vessels and staff residents of institutions. Finally, non-institutional group quarters include individuals living in other non-household living situations (e.g., YMCAs, youth hostels) and in living quarters for victims of natural disasters. Details on various types of non-institutional group quarters appear in the definitions section of the 2005

---

Republic of Palau Census of Population and Housing cross-tabulations.

Limitations. Two types of errors can occur in the classification of types of group quarters: misclassification or no classification. During the 2005 Special Place operations, like those in 1990, 1995, and 2000, enumerators determined the type of group quarters associated with each special place in their assignment. OPS personnel subsequently edited unacceptable codes for group quarters.

Comparability. Because few persons in Palau live in institutional group quarters, the definitions have remained relatively consistent over the last few censuses. The changes that did occur should not significantly affect the comparability of data with earlier censuses because of the relatively small number of persons involved.

From the 1980 Census onward, 10 or more unrelated persons living together were classified as living in non-institutional group quarters. The 1990 and subsequent censuses classified workers' dormitories as group quarters regardless of the number of persons sharing the dorm. In 1980, 10 or more unrelated persons had to share the dorm for it to be classified as group quarters. In 1990 census data products, the phrase "inmates of institutions" was changed to "institutionalized persons," and the Republic of Palau continued this phrasing in later censuses. Also, persons living in non-institutional group quarters were referred to as "other persons in group-quarters," and the phrase "staff residents" was used for staff living in institutions. Although the 1990 and later censuses added institutional categories and non-institutional group quarters categories compared with the 1980 census, most of these categories were never used.

### *MARITAL STATUS*

The 2005 census collected information on marital status with questionnaire item 6, asked of all persons. The marital status classification referred to the status at the time of enumeration. The Republic of Palau Office of Planning and Statistics tabulated data on marital status only for persons aged 15 years and older. All persons were asked whether they were "now married," "widowed," "divorced," "separated," or "never married." Couples who lived together (unmarried persons, persons in common-law marriages) were allowed to report the marital status they considered the most appropriate.

- Never married — includes all persons who never have been married, including persons whose only marriages were annulled.
- Ever married — includes persons married at the time of enumeration (including those separated), widowed, or divorced.
- Now married, except separated — includes persons whose current marriage has not ended through widowhood, divorce, or separation (regardless of previous marital history). The category also may include couples who live together or persons in common-law marriages, if they consider this category the most appropriate. In certain tabulations, currently married persons are further classified as "spouse present" or "spouse absent."
- Consensually married — includes couples who live together or persons in common-law marriages, with or without a legal document, if they consider this category the most appropriate.
- Separated — includes persons legally separated or otherwise absent from their spouse because of marital discord. Included are persons who have been deserted or who have parted because they no longer want to live together but who have not obtained a divorce.
- Widowed — includes widows and widowers who have not remarried.
- Divorced — includes persons who are legally divorced and who have not remarried.
- Now married — includes all persons whose current marriage has not ended by widowhood or divorce. This category includes persons defined above as "separated."
  - Spouse present — includes married persons whose wife or husband was enumerated as a member of the same

household, including those whose spouse may temporarily have been absent for travel or hospitalization.

- Spouse absent — includes married persons whose wife or husband was not enumerated as a member of the same household. This category also includes all married persons living in group-quarters.
- Separated — defined above.
- Spouse absent, other — includes married persons whose wife or husband was not enumerated as a member of the same household, excluding separated persons. Included is any individual whose spouse was employed and living away from home or in an institution or absent in the Armed Forces.

When a person did not report marital status, the OPS imputed this information according to the relationship to the householder and sex and age of the person.

**Limitations.** There are no obvious limitations in the 2005 census data on marital status.

**Comparability.** The 2005 marital status definitions were about the same as those used in 1990 and 1995, but the 1980 Census used the term “single” instead of “never married.” Also, the category “consensually married” was dropped in the 1990 census.

## Analysis of Data on Households, Families, and Marital Status

### Households and Families

Persons in households decreased from 97.5 percent to 81.1 percent of the total Palau population between 1980 and 2000, but then increased to 91 percent in 2005, showing the effect of the smaller number of non-Palauans in the country (Table 5.1 and supporting graphs in Figures 5.1, 5.2 and 5.3). The decrease was small between 1980 and 1990, but after that, through 2000, the massive immigration of foreign workers greatly influenced the percentages in households and in group-quarters. The absolute number of persons living in households increased by only about 1,000 persons during the decade of the 1990s, but the number living in group quarters increased more than 5 fold during the decade, from about 700 people (including those living in the Palau Community College dormitories) to about 3,600 people in 2000, before decreasing to 1,700 in 2005.

Table 5.1. Household Characteristics: 1970 to 2005

Characteristics	2005	2000	1995	1990	1980	1970
Total persons:	19,907	19,129	17,225	15,122	12,116	11,210
In households	18,182	15,520	14,439	14,440	11,813	10,769
Percent	91.3	81.1	83.8	95.5	97.5	96.1
In group quarters	1,725	3,609	2,786	682	303	441
Percent	8.7	18.9	16.2	4.5	2.5	3.9
Inmate of institution	6.0	1.8	3.8	9.8	-	4.8
Other	94.0	98.2	96.2	90.2	100.0	95.2
Persons per household	3.9	4.6	4.9	5.0	5.8	6.2

Sources: USBC, 1972, Table 5; 1983, Table 15; 1992c, Table 7, 1995, 2000 & 2005, Table 7.

Figure 5.1. Percent in Households and Persons in Households for Palau: 1970 to 2005

Figure 5.2. Persons per Household by State, Palau and Persons per Household for Koror: 2005

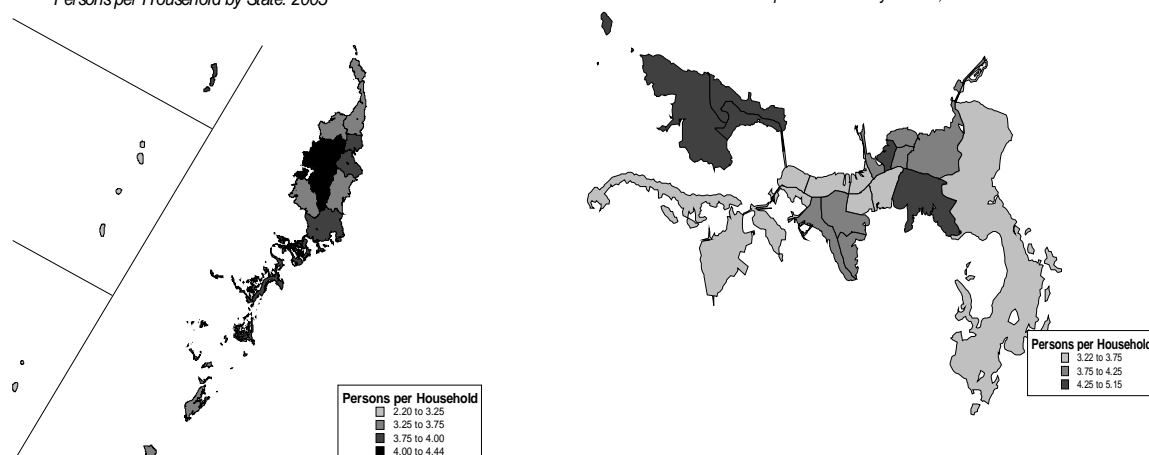

Figure 5.3. Persons per Household by State, Palau and Persons per Household for Koror: 2005  
*Persons per Household by State: 2005* *Persons per Household by Hamlet, Koror: 2005*

The number of persons per household declined substantially between 1970 and 2005, a decrease of about 2 people per household. More than 6 persons were living in each household, on average, in 1970, and this declined by an average of one person, mostly during the decade of the 1980s, to 5.0 in 1990 and 4.9 in 1995, before continuing a fairly rapid decline to less than 4 in 2005. The number of persons per family also decreased during the 1980s, by about the same amount as the decline in persons per household. Data on the number of persons per family are unavailable for 1970.

Table 5.2. Relationship to Householder: 1970 to 2005

Characteristics	2005	2000	1995	1990	1980	1970
Total persons:	19,907	19,129	17,225	15,122	12,116	11,210
In households	18,182	15,520	14,439	14,440	11,813	10,769
Percent	100.0	100.0	100.0	100.0	100.0	100.0
Householder	25.9	21.6	20.6	20.0	17.3	16.3
Spouse	14.3	13.6	13.5	12.8	12.1	11.5
Child	28.9	33.2	34.2	36.6	49.0	57.9
Other relative	19.8	25.2	26.7	24.1	20.7	13.0
Non-relative	11.1	6.5	5.0	6.5	0.9	1.3

Sources: USBC, 1972, Table 5; 1983, Table 15; 1992c, Table 7, 1995, 2000 & 2005, Table 7.

The composition of households in Palau also changed between 1970 and 2005 in terms of relationship to the householder (Table 5.2). In 2005, more than 25 percent of total household members were householders, up from more than 20 percent in 2000; this figure is 5 percentage points higher than 2000, with the latter being about the same as in 1990 and 1995, but an

increase of nearly 3 percentage points during the 1980s. The increase in the 1980s continued a trend found between 1970 and 1980 and is consistent with the decreasing family and household size noted above for that period. The tendency for family size to decrease as fertility decreases emerges in the declining percentage of children. The percentage of household members being children decreased by half during the period 1970 to 2005, from 58 percent to 29 percent. Also, the percentage of other relatives in Palau households both increased substantially between 1970 and 2000, but decreased between 2000 and 2005. On the other hand, the percentage of non-relatives increased substantially between 2000 and 2005. The increases in these two categories over the 1980s were partly due to changing migration patterns. Growth and decline in the percentage of "other relatives" probably reflected the presence of movements of Palauans residing in the home of a relative. Growth in the percentage of non-relatives partly involves immigrants from other countries residing with Palauans or with persons from their own country.

Koror and Airai states, by virtue of their population sizes, once again greatly influenced the distribution of relationship by state (Table 5.3). Ngatpang and Ngaremlengui had the largest households on average; Hatohobei had by far the smallest household size, followed by Sonsorol. Differences between states in Palau also existed in household composition. The percentage of each household

Table 5.3. Household Characteristics by State in Percentages: 2005

State	Persons In Households	Total Households	Householder	Relatives				Persons per:	
				Spouse	Child	Other	Non-family	Household	Family

represented by the householder varied little geographically. However, the percentages of other household members differed considerably between states — the data once again dominated by Koror and Airai states. The distribution of non-relatives across the states was similar, except in a few states like Hatohobei, Ngardmau, and Sonsorol, with very few non-relatives in the households.

### Marital Status

Information on marital status is rarely used for planning or policy use, but often is of interest to the general public. Data on marital status also are important in connection with fertility. When females delay marriage — for schooling, to enter the work force, or for some other reason — they decrease both their period of exposure to fertility and their total fertility. Reduced fertility, of course, has important direct implications for population structure, and hence important indirect implications for planning and policy issues.

Married males in Palau approached 60 percent of all adult males in 2005, a substantial increase from 2000, probably showing the out-migration of young males (as was seen earlier in the absolute counts and in the sex ratio) (Table 5.4). The percentage married was higher than in any previous census, while the percentage single was lower. The proportion of married males over time shows no particular pattern, so may be influenced by the marital status of the particular immigrants coming to Palau over time.

Table 5.4. Marital Status for Males 15 Years and Older: 1970, 1973, 1980, 1990, 1995, 2000 & 2005.

Notes: Figures for 1970 only for ages 14 years & over; figures for 1973 consider only TTPI-born persons

The percentage of females in Palau aged 15 years or more and married also increased to its highest level in this series of census reports, to 55 percent (Table 5.5). And the percentage single was lower than in any of the previous censuses. Again, this probably shows out-migration of young, single females for work, schooling, and the military.

The proportion of females in Palau separated or divorced from their spouses continued to be higher than for males, as it was in previous censuses. The percentage of widows in Palau greatly exceeded the percentage of widowed males for all census years examined in tables 5.4 and 5.5, a consequence of females tending to live longer than males. Data in these two tables also show a substantial increase in the percentage of widowed females over the period of the 1970s and 1980s, while the proportion of widowed males remained relatively constant.

Considerably more than half the males in the most of the states in Palau were married (Table 5.6). Males in the more rural states were to be more likely to be married. Rural states were more likely than urban states to contain widowed males in 2005.

Table 5.6. Marital Status for Males by State in Percentage: 2005

State	Total	Per-cent	Never Married	Now Married	Sepa-rated	Widow-ed	Divo-rced
Males:	8,245	100.0	35.5	59.7	2.0	1.1	1.7

Source: OPS, 2005 Census, Table 6.

Considerable geographic variability also existed in the marital status of females among the states in Palau in 2005 (Table 5.7). More than half of the adult females in most of the States were married. This percentage of married women in Koror State was less than that found in the republic as a whole — possibly due to migration patterns, possibly to more Westernized urban females to marry later than females living elsewhere. Problems with small numbers limit many of the insights on female marriage patterns for individual states.

Table 5.7. Marital Status for Females by State in Percentage: 2005

State	Total	Percent	Never Married	Now Married	Separated	Widowed	Divorced
Females:	6,864	100.0	28.9	55.0	3.0	9.7	3.4

Source: OPS, 2005 Census, Table 6.

Changing marriage patterns also emerge in the *singulate mean age at marriage* (Table 5.8), the average age at first marriage for a group of people (Hajnal, 1953). In 2005 the singulate mean of age at marriage for the population of Palau was 28.0 years. This rate showed a slight decrease from 2000, but previously, the rate increased steadily by about 3 years, over the preceding 27 years. The singulate mean age at marriage increased for both males and females between 1973 and 2000, before declining for both sexes in 2005, with the mean age of the males exceeding that of the females in all census reports. Since most females in Palau still give birth within marriage, this increase in age at first marriage tends to increase the age when their first child is born — in the process decreasing total fertility (Figure 5.4).

Figure 5.4. Mean Age at First Marriage: 1973 to 2005

Table 5.8. Singulate Mean Age at Marriage: 1973, 1980, 1990, 1995, 2000 &amp; 2005

Sex	2005	2000	1995	1990	1980	1973

## Conclusions:

Both household composition and marital status have changed in Palau over the past three decades. As immigration to the republic continued, dominated at least in the last decade by working age males, the percentage of the total population living in households decreased. But migration patterns shifted between 2000 and 2005, and this change is seen in the household composition and marriage rates. Within Palau, increased evidence existed of relatives moving from rural areas to urban areas for schooling and jobs — changing the composition of the households and families in both the urban and rural areas — but this pattern may also be changing. The selective emigration of other Palauans for schooling and jobs on Guam, in the CNMI, in Hawaii, and on the U.S. mainland also affects the composition of the families and households remaining in Palau.

Marital patterns also have evolved in Palau over the last 30 years of the 20<sup>th</sup> century and into the 21<sup>st</sup> century. In general, the percentage of married individuals increased between 1970 and 2005 among both males and females. The proportion of males separated or divorced increased substantially, as did the percentage of widowed females — the latter showing increased life expectancy more than change in marital behavior. Both males and females tended to continue to be older when marrying for the first time as time has passed. As with household composition and many other topics covered in this monograph, these changes in marital patterns are in part a consequence of recent migration flows, for example, the selective emigration of single individuals and the selective immigration of married males unaccompanied by their families.

## CHAPTER 6. FERTILITY

Fertility plays a vital role in giving shape to the age-sex structure and in producing the change in population size. The age distribution of a population is more sensitive to changes in fertility than to changes in mortality. The proportion of a population that is young or old depends mainly on the birth rate and not on the death rate, because as people live longer, the population structure, as a whole, becomes older rather than younger. A population has an increasing proportion of older people when the birth rates fall and not because the death rates fall. Any decline in mortality makes the age distribution younger as more children survive. The decline in mortality has very little effect at middle ages. On the other hand, any decline in fertility necessarily makes the population older since it reduces the proportion of children.

Measures of fertility quantify the birth performance over time. These measures can be used to compare the fertility levels of different populations during a particular time to show trends in fertility. Fertility measures include crude birth rate, gross fertility rate, general fertility rate, and rate of reproduction. Analysis of fertility trends in the Pacific is not abundant, and Palau is no exception. Although Palau has had regular censuses, and a great deal of information has been collected, no one looked systematically at fertility trends until the mid-1980s (Levin and Retherford 1986).

Like mortality, fertility began to decline in many developing countries in recent decades, and in Palau, the fertility decline in recent years has been striking. However, in spite of significant reductions, birth rates (the number of births per 1,000 population) in Palau remain higher than in the United States and other economically "developed" countries.

### Definitions

Census data on fertility (also referred to as *children ever born*, *children surviving*, and *information about last birth*) were derived from answers to questionnaire item 18a, which was asked of women 15 years old and over regardless of marital status. Stillbirths, stepchildren, and adopted children were excluded from the number of children ever born, children surviving, and last births. Ever-married women were instructed to include all children born to them before and during their most recent marriage, children no longer living, and children away from home, as well as children who were still living in the home. Never-married women were instructed to include all children born to them.

Children ever born is the count of all children ever born to a woman without regard to which husband was the father, or whether she was married when she gave birth. Children surviving include all children still alive at the time of the census, whether or not they were living with her. Last births report information about the last birth, without regard to sex of the child, or its current – at the time of the census – vital status.

Data are most frequently presented in terms of the aggregate number of children ever born to women in the specified category and in terms of the rate per 1,000 women. In 1990, for purposes of calculating the aggregate, the open-ended response category '15 or more' children was assigned a value of 15; in 1995 and later, the open-ended category was for "20 or more" children and was assigned a value of 20.

Comparability. — The wording of the question on children ever born was the same in all recent censuses. In 1970, however, the terminal category was '12 or more' children ever born. In virtually all of the tables in 1970 census volume, data presented on children ever born to all women assumed that single women were childless, even though it was known that some of the women had had children. Therefore, rates and numbers of children ever born are not comparable between 1980 reports and previous census reports. Data presented for children ever born for the 1980 and later reports are comparable as well as all tables for all census years that show data for ever-married women.

In the text of this report, sometimes we use "12 or more" and other times "15 or more", but since few women in Palau have more than 4 or 5 children, the results of tabulations are not affected by these different categorizations.

Table 6.1. Children Ever Born by Age of Woman: 1980 to 2005

Age Group	Children Per 1000 Women				
	2005	2000	1995	1990	1980
Total:	2,430	2,129	2,475	2,790	3,286

## Analysis of Fertility Data

## Fertility by Age

Table 6.1 shows the number of children ever born per 1,000 women in the 1980 to 2005 censuses. The number of children ever born per 1,000 women is a standard measure used in large countries to give several significant digits.

However, in small countries like Palau, an easier measure to use might be *children per woman*. For example, in 2005, Palau had about 2,860 per 1,000 women 45 to 49 years old, the same as in 2000 (See Figure 6.1). Since there were so few women in this age group in Palau, the last digits in the rate are not significant, and the number is not particularly easy to use.

We can think of the rate as 2.9 children per woman, meaning that the average woman 45 to 49 years old in Palau in 2000 had had 2.9 children up to that age. In most cases, fertility is over by that age, so this value gives a pretty good estimate of the total fertility rate for these women — the total number of children these women would have during their reproductive periods.

Figure 6.1. Children Ever Born by Age Group, Palau: 2005; and Per 1000 Females Ages 45 to 49 years: 1980 to 2005

So, the average woman 45 to 49 years old in Palau had 2.9 children. If the average woman has about 2.1 children, the population would remain steady, neither increasing nor decreasing (this value might be exactly 2 to replace the mother and the father, but some people die before reproducing, so we factor that in.) At the rate of 2.9 children per woman, the population would double over time. However, the number of children per woman is decreasing over

time. For example, in the 1980 census, the average woman in this age group — 45 to 49 years old — had had 6.7 children (and in 1973 the value was 7.7). The value decreased to 4.4 children per woman in 1990 and 3.5 in 1995. Therefore, while the total fertility rate was almost 8 children per woman in the early 1970s, the value declined rapidly during the period to less than 3 children per woman in 2000 and 2005. Table 6.1 also shows the total children ever born for all women 15 years and over. These values decreased from 3.3 children per woman in 1980 to 2.8 in 1990, 2.5 in 1995, to 2.1 in 2000, but back up to 2.4 in 2005.

Figure 6.2 shows the number of children per 1000 females 5 to 44 years old, traditionally when women's fertility is complete. In 2005, Hatohobei women had the highest fertility, an average of 5 children per woman; Aimeliik state was second, with more than 4 children per woman, but most of the other states had much lower fertility. Koror, as an urban area, had among the lowest fertility rates. The figures also show fertility for women in the various hamlets in Koror. Eang, with its Hatohobei residents, had the highest fertility in Koror, at somewhat more than 3 children per woman.

Figure 6.2. Children Per 1000 Females 35 to 44 Years Old, Palau and Koror: 2005

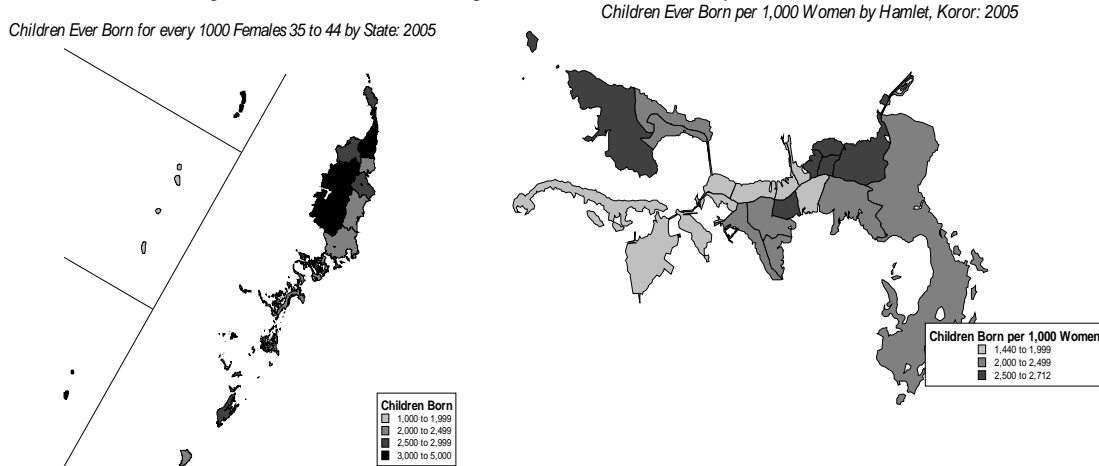

Figure 6.3 shows maps of the same information. It is clear from the map of the States that the States farthest from the Center – Koror – have the highest fertility, in general. The hamlet map for Koror is less clear cut because the whole area is urban, so lower fertility is expected.

Figure 6.3. Children Ever Born per 1000 Females 35 to 44 by State, Palau and Koror: 2005

We see that the values for ages below the 45 to 49 year group tend to be lower. For the younger ages, many women have not completed their fertility, so the values would be lower. Many of these women are controlling their fertility — delaying starting families, waiting longer before having more children, and having fewer children over all. Some of the older women forget children they had, especially those who died young, others had fewer children because health care wasn't as good in the past, so fewer children were born.

Table 6.2. Children Ever Born by Age and Marital Status of Woman: 2005

Age Group	All Women			Ever Married Women		
	Women	Children Ever Born	Children per 1,000 Women	Women	Children Ever Born	Children per 1,000 Women
Total:	6,864	16,716	2,435	4,878	15,780	3,235

Source: OPS, 2005 Census, Table 8.

In many societies around the world, children ever born in censuses is only collected from ever married women, but if we did that in Palau, we would lose information about the fertility of the population. While the average woman in 2000 had 2.4 children, the average ever-married woman had 3.2 children, an average of almost one additional child (Table 6.2). What this means is that women who have never married have fewer children than those who do marry, a not unreasonable finding. Women are more likely to have children within marriage than before marriage since the period of time is longer. Table 6.2 shows that at every age the children per 1,000 ever married women in 2005 was greater than the number of children ever born for all women.

### Fertility by Birthplace of Mother

Mothers born on Palau tended to have higher fertility than immigrant women in every census between 1980 and 2005 (Table 6.3 and Figure 6.4). The average mother aged 15 to 44 years in 2005 had 1.8 children, down from 2.1 in 1980, but greater than in previous census years – a decrease of

almost one child. The decrease for Palau-born women was less, from 2.1 to 1.8 children per woman over the whole time period, while the decrease for immigrants, going from 1.5 children per woman in 1980 to .3 in 2005 left migrant women with very small total fertility. Some of these differences are explained by young, single immigrant women who have never married. Also, a general self-selection for migrants without children is likely.

Table 6.3. Children Born to Mothers Aged 15-44 by Birthplace: 1980 to 2005

Children Ever Born	Birthplace			Per 1000 Women		
	Total	Born on Palau	Not Born on Palau	Total	Born on Palau	Not Born on Palau
2005	5,042	3,213	1,829	1,604	1,815	332
2000	5,232	4,097	1,135	1,170	1,515	642
1995	5,807	4,583	1,224	1,445	1,775	854
1990	5,309	4,485	824	1,596	1,716	1,156
1980	4,979	4,752	227	2,082	2,121	1,493

Source: USBC, 1984, Table 24; 1992c, Table 46, 1995, 2000 & 2005 Censuses, Table 73.

In 2005, Palau-born women had higher fertility than women born outside Palau (Table 6.4). The average Palau-born woman had had almost 1.8 children compared to about 1.6 for all women in Palau. So, women born elsewhere had lower fertility. Palau-born females at each age had higher fertility than their immigrant counterparts. Palau-born females had higher fertility in each 5-year age group.

Generally a curvilinear relationship existed between fertility and educational attainment, a phenomenon seen in many countries, and usually attributed to lack of knowledge about health and sanitation being related to lack of formal education. The total figures in Table 6.5 do not completely show this relationship, but may be obscured by small numbers (although women with completed fertility are present in even smaller numbers.) Nonetheless, while the average female in Palau aged 45 to 49 in 2000 had 2.9 children, women who had only finished elementary school had had 3.4 children, those with some high school education had 3.3 children, high school graduates had 2.7 children, those with some college 2.9, and those with college degrees, 2.4 (See Figure 6.5). This curve was seen for most of the age groups of women. In general, except for the lowest educational attainment, the higher the educational attainment the lower the fertility. If Palau wants to reduce its fertility, one good method is to encourage women to stay in school longer!

Figure 6.5. Children per 1000 Females 45 to 49 by Educational Attainment.

Table 6.5. Children Ever Born Per 1,000 Women by Age & Educational Attainment: 2005

Age Group	Educational Attainment					
	Total	Elementary	High School	High School Graduate	Some College (inc AS)	College Graduate

Source: OPS, 2005 Census, Table 101.

Finally, in this section, we show children ever born by labor force participation of women. It is important to remember that the labor force participation is "current" labor force participation. While women moved in and out of the labor force as they had their children, we only have information for the time of the 2005 census. In 2005, the average woman between 16 and 49 years old had an average of 1.7 children (note that this value is lower than that used above because women aged 50 and over are excluded from this table)(Table 6.6).

Table 6.6. Children Ever Born Per 1,000 Women by Age and Labor Force Participation: 2005

Age Group	Total	In Labor Force				Not in labor force
		Total	Employed	35+ hrs	Unemployed	
Total	1,665	1,807	1,805	1,782	1,852	1,384
16 to 19 years	44	146	222	333	-	36
20 to 24	498	432	434	413	409	578
25 to 29	1,069	914	881	853	1,520	1,555
30 to 34	1,630	1,507	1,494	1,456	1,826	2,044
35 to 39	2,188	2,088	2,061	2,022	2,760	2,541
40 to 44	2,556	2,518	2,505	2,481	2,905	2,699
45 to 49	2,857	2,722	2,711	2,701	3,000	3,259

Source: OPS, 2005 Census, Table 111A

having fewer children than those "not in the labor" force. Women of this age in the labor force had had 2.7 children, while those who were not in the labor force had had 3.3 children, about half a child more. Women employed and at work had about 2.7 children, while those who were unemployed had 3.0 children.

### Direct Estimation of Fertility

Several indices can be calculated based on information on births and population for measuring fertility and reproduction. This information is not always free of errors as provided by vital registers, censuses, and surveys. One of the most frequently used indices is the crude birth rate, which is directly related to natality and population growth. Other indices, like the general fertility rate, age-specific fertility rates, and the total fertility rate, are used for measuring fertility levels and reproduction. Indices less frequently used or analyzed are the gross reproduction rate and the net reproduction rate; both of these are closely related to the concept of reproduction, or "replacement" of the population.

### Crude birth rate (CBR)

The crude birth rate, or the number of infants born in a year per 1,000 persons in a population, is calculated as the number of births occurring in a year divided by the population at midyear, times 1,000. Table 6.7 gives crude birth rates for recent years in Palau using the censuses as the base. The crude birth rate is the most frequently used measure of fertility, not only because it is easy to understand, but also because it requires the least amount of information. It shows the growth of population without considering loss through mortality or migration.

The crude birth rate includes men, children, and women outside reproductive ages in its base. Hence, the level of crude birth rate depends not only on the number of births, but also on the proportion of persons who are not subject to having children. Because it is affected by the sex and age structure of the population, this index is considered a "crude" measure. The crude death rate, another crude measure, will be discussed in the next chapter.

Table 6.7. Total Number of Live Births; Total Infant and Fetal Deaths; Crude Birth and Death Rates, and Infant and Fetal Mortality Rates, Palau: 1990 to 2005

Year Range	Population	Live Births	Crude Birth Rate	Deaths	Crude Death Rate	Infant Deaths	Infant Mort. Rate	Fetal Deaths
2005	19,907	279	14.0	134	6.7	6	21.5	5

Source: Bureau of Health Services, Republic of Palau, unpublished data.

Notes: Populations are estimated using 1990 and 2000 censuses as base. Crude birth and death rates are per 1,000 persons. Infant mortality rate per 1,000 live births.

### General fertility rate (GFR)

The simplest measure that limits the number of births to women of childbearing age is the general fertility rate, or the number of births in a year per 1,000 women ages 15 to 49 years. Although the general fertility rate represents a refinement over the crude birth rate, it still has its limitations. The frequency of births varies by age of woman within the span of reproductive ages, and so populations in which women have the same frequency of births at each age may have different general fertility rates due to differing age structures of women within the reproductive ages. We discuss the general fertility rate for Palau in 2005 later in this chapter.

### Age-specific fertility rates (ASFR)

An age-specific fertility rate is calculated as the number of births in a year to mothers of a specified age per woman (or per 1,000 women) of the same age at midyear. ASFR's are usually calculated for women in each 5-year age group for ages 15 to 49 years. Although ASFR's properly measure the fertility of women in each age group it is difficult to use them to make comparisons over time. In addition, they do not easily portray the overall level of fertility. For this, a summary index was developed, called the total fertility rate.

### Total fertility rate (TFR)

The total fertility rate is a summary measure independent of the age and sex composition of a population. It represents the average number of children a group of women would have by the end of their reproductive years if they had children according to a set of age-specific fertility rates pertaining to a particular year. In other words, if a group of women have been exposed to a given set of ASFR's from age 15 to age 50, the average number of children they would have by age 50 is the total fertility rate.

The TFR is derived by cumulating the age-specific fertility rates for all ages of women. When rates are calculated for the seven conventional 5-year age groups, the TFR is the sum of the rates for each age group, multiplied by five (the width of the age-group interval). The TFR can also be interpreted as the number of children that, on average, will replace each woman by age 50 if none of the children die.

### Gross reproduction rate (GRR)

The gross reproduction rate is a measure analogous to the total fertility rate, but it refers only to female births. Thus, it is derived in the same manner as the TFR but uses a set of age-specific fertility rates calculated based on female births only. As an acceptable approximation, it can also be derived by multiplying the TFR by the proportion of all births that are female. The GRR is usually interpreted as the average number of daughters that would replace each woman in the

absence of female mortality from birth through childbearing years, based on a given set of age-specific fertility rates. We discuss the gross fertility rate for Palau in 2005 later in this chapter.

As a fertility measure, the gross reproduction rate has no particular advantage over the total fertility rate. It gives an index of generational replacement: it shows the extent to which a group of women would be "replaced" by female children if the women had children according to a given set of age-specific fertility rates. It is a "gross" measure of replacement because it assumes that none of the girls die before they reach the age of their mothers in the reproductive years. In actual populations, some daughters do die before reaching childbearing ages.

Table 6.8 shows numbers of live births by half-year for the 1989 to 2005 period. Half years are given to assist in making estimates, since mid-year populations are usually used for this purpose. The number of births has jumped around somewhat, partly attributable to the small numbers of total births.

Table 6.8. Births by Sex and by Half-Year, Palau: 1989 to 2005

Year	Total	Male	Female	Males/100 Females	Total	First Half	Second Half

Table 6.9 shows births by age of mother from 1989 to 2005, data that can be used to obtain rough age specific fertility rates. These data can also be summed to obtain a rough – unadjusted – total fertility rate.

In the early to the middle part of the 1990s, more women gave birth when they were in their late 20s (25 to 29 years old), but the age specific value gradually decreased to less than 60 in 2005. This is a good indication of more women becoming more career-oriented, and delaying births and raising children. This also hold true to women age 30 to 34 years old.

Table 6.10 shows unadjusted age specific and total fertility rates based on women interpolated between census enumerations and actual births. In the table, the age specific rates are per 1,000 women, while the total are per woman. The table shows a continuous decline from 2.7 children per woman in 1989 to 1.6 in 2002 before increasing to 2.1 in 2003. Since 2.1 is approximately replacement, if fertility were the only demographic factor in play, the population would eventually decline based on the recent years. However, since many of the women "exposed" to fertility were foreign workers, they artificially lower the age specific and total rates. Similarly, the age specific rates remained low throughout the period. The own children fertility estimates that follow give indirect estimates of the age specific and total fertility based on a single source – in this case the various censuses having available micro-data.

Table 6.10. Age-specific Birth Rates per 1000 Women &amp; Total Fertility per Woman based on Reported Births &amp; Interpolated Woman, Palau: 1989 to 2005

Year	Total	10 to 14 years	15 to 19 years	20 to 24 years	25 to 29 years	30 to 34 years	35 to 39 years	40 to 44 years	45 to 49 years

## OWN CHILDREN FERTILITY ESTIMATES

The own-children method has been described in earlier publications and needs only to be recapitulated briefly here. (For more detailed accounts, see, for example, Cho 1973 and Retherford and Cho 1978.) The method is a census- or survey-based reverse-survival technique for estimating age-specific birth rates for years before a census or household survey. In most applications, enumerated children are first matched to mothers within households using information on age, sex, marital status, relation to head of household (or householder), and number of children still living. (For the 1973 and 1980 censuses of Palau, matching was based on a special question on mother's line number or person number in the household schedule, if mother was present.) These matched (i.e., own) children, classified by child's age and mother's age, and are reverse-survived to estimate numbers of births by age of mother in previous years. Reverse-survival is also used to estimate numbers of women in previous years. After adjustments are made for incorrect enumeration and unmatched (non-own) children, age-specific birth rates are calculated by dividing the number of births by the number of women.

Estimates are computed for each previous year or group of years back to fifteen years before the census. Estimates are not computed further back than fifteen years because births must then be based on children at ages 15 or older at enumeration, a large proportion of whom do not reside in the same household as their mother, and hence cannot be matched. All calculations are done initially by single years of age and time (years before the census). We obtain estimates for groups of ages or groups of calendar years by aggregating numerators and denominators of single-year rates and then dividing the aggregated numerator by the aggregated denominator. For reasons of economy, the method is usually applied to census samples rather than complete counts, but because of Palau's relatively small population, the applications were to the complete counts.

We allocate non-own (unmatched) children to mothers by multiplying each age-specific category of own (matched) children, specified by mother's age, by the corresponding age-specific ratio of all children to own children. Thus the number of own children at a given age is adjusted upward by the same factor regardless of mother's age, thereby introducing some error in the fertility estimates. The proportionate distribution of non-own children by age of mother generally differs somewhat from the proportionate distribution of own children by age of mother.

We cannot specify non-own adjustment factors by age of mother since the mother of an unmatched child is by definition not in the household. Since older women are usually in more stable households than younger women, the nature of the error from not specifying non-own adjustment factors by mother's age is usually to reallocate erroneously a certain proportion of non-own children of a given age from younger mothers to older mothers. This error, if present, usually has little effect on the total fertility rate, but it produces an age pattern of fertility that is too low at the younger ages and too high at the older ages. The error is minor if the adjustment factors for non-own children are low, but sometimes these factors can be quite high.

Table 6.11 shows own children fertility estimates from six censuses. The data mesh well with what we discussed in earlier sections of this chapter. The own children tabulations were made at the East-West Population Institute (EWPI) for the 1973 data, and at the Bureau of the Census for the 1980 through 2005 censuses. The Microcomputer package developed by the East West Center's Population Program processed for the data sets — in fact, all four Pacific Islands areas were run in one afternoon for the 1990 censuses. The same program was used for the 1995, 2000, and 2005 data. The total fertility rates decreased precipitously throughout this period, roughly from 1960 to 1990, from almost 9 children per woman at the beginning to about 3 per woman in 1990. That is, the average woman in Palau in 1960 had about 9 children during her reproductive period, but this average decreased to 3 by 1980, a decrease of about two-thirds. The total fertility continued to decrease in recent censuses, with 2005 showing a rate below replacement because of the low fertility of Palau's females, especially non-Palau-born females.

Table 6.11. Total fertility Rates and Age-Specific Birth Rates.

Derived by Own-children Method, Palau: 1973 to 2005

Period of Estimate	Total Fertility Rate	Age-Specific Birth Rates (per 1000 women)

Notes: Rate per woman for TFRs, per 1000 women for Age-Specific Rates

The age specific fertility rates also decreased for all ages throughout the whole period. For example, while females 30 to 34 in the early 1960s were having about 360 births per 1000 females in a year, by the late 1970s, this value decreased to 155 births per 1000, less than half of the early figure, and to 118 in 1995 and 126 for 2000; hence, the rate was about  $\frac{1}{3}$ <sup>rd</sup> of its original. The rates continued to decline after that, for the most part.

Figure 6.6. TFR Estimates, Palau: 1967 to 2005

The total fertility rate also declined throughout the period as well, from over 8 children per woman in the 1960s to less than 2 during the period immediately before the census. This latter number is deflated somewhat because of the foreign women in Palau. Figure 6.6 graphically shows the continuous decrease in the Total Fertility Rate over time. Here, we include results from the 1967 census as well, although they are a bit shaky because the collection methodology is unknown. The figure shows single year, rather than 5-year estimates, but the decline in the overlap is relatively consistent.

Finally, Figure 6.7 shows age specific fertility rates for the mid-point of each 5 year period before the 2005 Census. These results also show a continuous decrease in the age specific rates (with one exception at age 30 to 34). Unlike the previous figure, the same females appear in the denominator throughout the series – the numerators, as before, come from the reported births. The results show continuing low fertility, fertility, which is likely to continue to decline.

Figure 6.7. Age-specific Fertility Rates : 1967 to 2005

## CONCLUSIONS

In this chapter we have looked at the fertility of Palau's population. Both the direct information on children ever born and the indirect information obtained from the various demographic methods of analysis show dramatic fertility decrease in the recent past. This decrease is apparently continuing as females move into the labor force and either delay onset of fertility or increase the time between adjacent children, or both. The total fertility rate is already among the lowest in the Pacific, and is likely to decrease even more as older women with larger families leave the reproductive years to be replaced with younger women with smaller families.

## CHAPTER 7. MORTALITY

Some censuses ask questions to obtain direct information on mortality. For example, a question will ask "Did anyone die in this household during the last 12 months? If so, who?" However, the 2005 Palau census asked no direct questions on mortality.

Also, some censuses or surveys ask questions to obtain indirect information on mortality. Questions on children ever born and children surviving by age of mother can be used to obtain various indirect measures of mortality. The 1973, 1980, 1995, 2000 and 2005 censuses of Palau asked these questions. However, these questions were not asked on the 1990 census because most of the U.S. Pacific Islands areas had complete vital registration, with almost all deaths recorded. Since the deaths are recorded by age and sex, these data are used to obtain age specific death rates, and other measures derived from them. In this chapter we look at some of these measures.

### MORTALITY

The most important demographic event in this century has been the great decline in mortality. Palau has experienced that decline. Mortality levels became more independent of economic development than before. This decline is based on better health services provided by the National Hospital and independent medical clinics.

When reliable information on deaths and population is available from registers and censuses, direct calculations of mortality can be made. The crude death rate is the most common and the easiest to calculate. Often more complicated measures are needed because they provide additional information. Infant mortality, in particular, is an important indicator of a country's development. Age-specific death rates for other ages are also important in deciding which areas to target for particular programs. Life expectancy is a useful measure because it takes into account the mortality at each age yet expresses the result in a single figure.

Reliable information on population and registered deaths is used to measure the level of mortality in a population. The indices for this measure are:

- (1) crude death rates (with possibilities for direct or indirect standardization); and,
- (2) construction of life tables to obtain life expectancies at birth and other useful mortality functions.

### Crude death rate (CDR)

The most common direct measure of mortality is the crude death rate, or the number of deaths per 1,000 population. It is calculated as the number of deaths occurring in a year divided by the population at midyear, times 1,000.

Table 7.1 shows deaths by 5-year broad age groups from the years 1989 to 2005.

Table 7.1. Deaths by 5-Year Age Group: 1989 to 2005

Table 7.2 shows average numbers of deaths for 1990 (averaging 1989 to 1992), 1995 (averaging 1993 through 1997), 2000 (averaging 1998 to 2002), and 2005 (averaging 2003 to 2005). By dividing age-specific deaths by the census population for the respective years, we can get an estimate of the age-specific mortality rates, in this case, the rates per 1000 population. Hence, the totals in the last three columns are the crude death rates (CDRs).

Table 7.3 shows male crude death rates higher than those of females because males die younger than females, and shows female crude death rates for the three periods. These rates are lower than for the males.

### Infant mortality rate (IMR)

When vital registration data are available, the infant mortality rate is usually calculated as the ratio of the number of deaths of infants under 1 year of age to the number of live births occurring that year, times 1,000. A more refined rate would take into account a process for relating infant deaths to their actual birth cohort because in reality some of the deaths occurring each year correspond to infants born during the previous year, just as some infants born in the current year will die the following year before reaching their first birthday. For practical purposes, however, the calculation based on one chronological year is a good approximation of the IMR based on a given year's vital registration data or on average of data for several consecutive years.

Table 6.7 showed the Infant Mortality Rate for calendar years 1990 to 2005. For example, the 6 deaths in 2000 for the 278 births made an infant mortality rate of 25 per 1,000.

### Age-specific death rates

While mortality is very high at the early moments of life, it declines rapidly thereafter, reaching its lowest levels between 10 and 15 years of age. In subsequent years, the older the age, the higher the mortality. The age specific death rates are calculated as the number of deaths in a particular age group per 1,000 population in the same group. Table 7.2 shows age specific death rates for Palau based deaths over the 1989 to 2005 period, and the 1990 to 2005 age distribution.

### Life Expectancy at Birth

One of the most useful summary measures of the overall level of mortality of a population is the life expectancy at birth. It is a more accurate reflection of mortality than the crude death rate because it is independent of the population's age structure, and it is not influenced by extraneous factors like the selection of a standard population.

Calculation of the life expectancy at birth begins with a set of age-specific death rates, from which probabilities of surviving from one age to the next can be estimated. These survival probabilities are applied to an assumed cohort of births that occurred in the same year, following the survivors as they reach successive ages until all have eventually died. As a result of this procedure, a count can be obtained of the total number of years that the birth cohort as a whole would live under the observed mortality conditions. The ratio of all years lived by the total number of people in the cohort to the original number of births represents the average number of years to be lived by persons born in the same year under the particular mortality conditions of that year. This ratio is the *life expectancy at birth*. These steps calculate the life expectancy at birth and are also the steps required to construct a life table. We pass to that now.

### Life Tables

Tables 7.4 and 7.5 show abridged life tables for males and females, respectively, based on deaths and population. A Population Analysis Spreadsheet (PAS) computed a West life table from deaths and population by age and has an option for using an independently calculated or estimated infant mortality rate.

A life table serves useful purposes both within the demographic community and in the world at large. For example, the life table is the source of estimates of the life expectancy at birth. In addition, it provides survival ratios for each age or age group that are used in making population projections.

A life table follows a hypothetical cohort of 100,000 persons born at the same time (called the "radix" of the life table) as they progress through successive ages, with the cohort reduced from one age to the next according to a set of actual death rates by age, until all persons eventually die. A complete, or unabridged, life table is constructed by single years of age, while an abridged life table is constructed by 5-year age groups. A life table can be constructed for both sexes together or, more commonly, for each sex separately.

The construction of a life table consists of calculating various interdependent "functions," using as a base the available age-specific death rates. The first function calculated in the life table is the probability of dying between two exact ages, for example, the probability that a person of exact age 30 will die before reaching his or her 35th birthday. This function is symbolized as  ${}_nq_x$ , where  $x$  represents exact age  $x$  and  $n$  is the age interval. In the above example, the symbol would be  ${}_5q_{30}$ . In applied demography, the only  ${}_nq_x$  function that is frequently used is  ${}_1q_0$  representing the probability of dying

between birth and age 1; this is usually called the infant mortality rate.

The next life table function is the number of persons surviving to each exact age. As the life table usually starts with a radix of 100,000 births (at exact age 0), the number of survivors from birth to each exact age is obtained using the probabilities estimated. The number of survivors at each exact age is represented by the symbol  $l_x$ .

The value for survivors at exact age  $x$  ( $l_x$ ) is shown in symbols as

$$l_{x+n} = l_x (1 - nq_x) \text{ where } nq_x \text{ is defined as above and the first } l_x \text{ is } l_0 \text{ and usually is defined as 100,000.}$$

Since  $l_x$  represents the number of persons alive at each exact age  $x$ , the difference between two consecutive values represents the number of deaths between the corresponding ages. This number of deaths between two exact ages is symbolized by  ${}_n d_x$  in the life table.

In symbols, this is shown:  ${}_n d_x = l_x - l_{x+n}$  where  $l_x$  is as defined above.

Actual populations are usually enumerated in a census or survey as the number of persons alive between two ages, for example, the population at age 23 (that is, persons between their 23rd and 24th birthdays) or the population in the age group 15 to 19 years (persons who have reached their 15th birthday but not yet their 20th). A life table includes an analogous population, represented by the  ${}_n L_x$  function, referred to as the "life table population" between exact age  $x$  and  $x+n$ , or the number of survivors between exact age  $x$  and  $x+n$ . For example, the symbol  ${}_5 L_{55}$  refers to the life table population at ages 55 to 59 years.

This life table population may be interpreted in three ways, following through time a cohort of births under mortality conditions observed during a year: (1) a "stationary" population with 100,000 annual births and deaths, the number of persons in each age group not changing; (2) persons in a particular age group as the survivors of 500,000 births occurring during a 5-year period (at 100,000 per year); and (3) the total life table distribution may be interpreted as the survivorship pattern of a single cohort of 100,000 births as it passes through all ages. The  ${}_n L_x$  function is calculated as the average of two consecutive  $l_x$  values that represent persons alive at two specified exact ages. This value is obtained:

$${}_n L_x = {}_n k_x l_x + (n - {}_n k_x) l_{x+n} \text{ where } {}_n k_x \text{ and } l_x \text{ are defined above.}$$

The next function refers to the age-specific death rates of the life table population, which are also called central death rates. These rates are derived by dividing the life table number of deaths between two specific ages by the life table population between the same ages. Central death rates are shown as

$${}_n m_x = {}_n d_x / {}_n L_x \text{ where } {}_n d_x \text{ and } {}_n L_x \text{ are as defined above.}$$

Next, the total population of the life table is calculated by summing all the  ${}_x L_x$  values. When the life table is seen as the following of a single cohort through time, the  ${}_n L_x$  values represent the total number of years to be lived by the original birth cohort of 100,000 until all persons have eventually died. A cumulative summation of the  ${}_n L_x$  values from the oldest ages to the youngest one represents, at any given age  $x$ , the total number of years remaining to be lived by all persons who are still alive at age  $x$ . It also represents the population age  $x$  years and over. The cumulative values for each age are represented by the symbol  $T_x$ , the sum of these values.

At this point, the life expectancy can be derived. The ratio of the number of years that the life table population will live from age  $x$  up to the point when all have died, to the number of persons alive at exact age  $x$ , represents the average number of years remaining to be lived by those who are alive at each age  $x$ . These values are the life expectancy at any given age, symbolized by  $e_x$ . For example,  $e_{35}$  represents the number of years of life remaining for a person age 35, while  $e_0$  represents the life expectancy at birth. The life expectancy at age  $x$  is:

$$e_x = T_x / l_x \text{ where } T_x \text{ and } l_x \text{ are as defined above.}$$

Finally, an optional life table function exists, used in making population projections, known as the survival ratio. Since the  ${}_5 L_x$  function is the number of persons alive between ages  $x$  and  $x + 5$ , the ratio of two consecutive  ${}_5 L_x$  values represents the survival between the two age groups. For example, at the end of the 5-year period, persons in the group

${}_5L_{30}$  are the survivors of the group  ${}_5L_{25}$ , and hence the ratio of  ${}_5L_{30}$  divided by  ${}_5L_{25}$  represents the average chance that a person in the age group 25 to 29 has of surviving 5 years to ages 30 to 34. This ratio is symbolized by  ${}_5P_{25}$  and is called the 5-year survival ratio for ages 25 to 29. The survival ratio is shown:

$${}_5P_x = {}_5L_{x+5} / {}_5L_x \text{ where } {}_5L_x \text{ is as defined above.}$$

The ratio is used for projecting population by multiplying the population times the survival ratio for any particular population by year. Special attention must be paid to the youngest and oldest groups, but we are not covering that here. Table 7.4 gives the life table for males in Palau in 2005. The last column is the most important for the average user since it gives the number of expected more years of life at any given age. For example, the first line shows that the average male, when he is born, is likely to live more than 66 years.

Table 7.5 shows the female abridged life table. Here, the average female, when she is born, is likely to live about 72.1 years. The other columns have significance to demographers, but we won't describe them here.

Table 7.6 shows summary demographic indicators based on population by age and sex and total deaths. This spreadsheet computes the Coale-Demeny West region model life tables, by sex, consistent with the population, by age and sex, and the crude death rates. In 2000, the life expectancy for females was 72 years and for males has 66 years.

Table 7.6. Summary Demographic Indicators, Palau: 2005

Item	Both sexes	Male	Female
Life expectancy	69.13	66.27	72.10
Infant mortality rate	0.032	0.040	0.024
Crude birth rate per 1,000 population	14.00	13.29	14.82
Crude death rate per 1,000 population	6.72	7.00	6.40
Rate of natural increase (%)	0.727	0.629	0.842
Total deaths	134	75	59

Source: OPS, 2005 Census, U.S. Census Bureau, Population Analysis Spreadsheets

## CONCLUSIONS

Palau continues to experience continued low mortality, and, therefore, high life expectancy at birth. Female life expectancy at birth was 72 years, based on the 2005 census. Both age specific mortality and infant mortality rates are low. Health care on island is very good, with both access and attention very high. Mortality data are not collected directly in Palau's censuses. Some countries collect data on deaths in the last year to get information to check against vital registration, but Palau has complete registration, so those data are not needed.

---

## CHAPTER 8. MIGRATION

While chapters 6 and 7 examined two basic components of population change — fertility and mortality — here we look at the other main component — migration. Measurement of migration is more complex than measurement of fertility or mortality. Mortality is purely a biological phenomenon; a favorable socioeconomic climate and medical care can postpone death, but cannot stop it. Fertility also is biological, although it can be controlled. Levels of fertility often reflect levels of material well being of a population, affected by individual and societal needs, levels of scientific knowledge, and economic status. The problems of measurement of fertility and mortality arise basically because of lack of reliable vital statistics.

Migration, on the other hand, is a socioeconomic phenomenon affected by many complex mechanisms involving social, psychological, economic, political, institutional, and other determinants. Migration affects the size, structure, and growth of populations. Migration also affects the size of the labor force, the distribution of labor force by skill, education, industry, and occupation, employment status, savings, investment, and productivity. In the process, migration leads to social and psychological affects on both origins and destinations.

Migration involves movement from one residence to another. Migration can be internal (within national or territorial boundaries) or international (across international borders). A migrant who travels from an origin to a destination is an immigrant or in-migrant with respect to the area of destination, and an emigrant or out-migrant with respect to the place of origin; in each case researchers tend to use the former term for international migration and the latter for internal migration.

Over the past two decades, migration has emerged as an extremely important factor shaping the population structure of the Pacific countries (Connell, 1990). Palau is no exception to this trend, although the mobility patterns affecting Palau often differ from those found elsewhere in the region (Gorenflo and Levin, 1992a). The pattern that dominated Palau from the early 1970s and throughout the 1980s was the emigration of Palauans — particularly to the CNMI, Guam, and the U.S. This emigration continues, but it is now more than counteracted by immigration of Filipinos and other Southeast Asians. These migration flows have had a major impact on the population structure of Palau, the most obvious consequence being the minimal population growth in the republic during the 1980s as native Palauans relocated outside the republic. In comparison, other mobility patterns, like the movement from rural to urban areas within Palau, apparently played lesser roles.

This chapter examines migration data from the 2005 census. These data include place of birth and parents' place of birth, citizenship, year of entry to Palau, residence in 2000, and ethnic origin or race. The types of information discussed complement each other, providing a reasonably complete picture of contemporary migration patterns in the republic.

### Definitions

#### *Place of Birth and Parents' Place of Birth*

Question 7 on the 2005 census questionnaire concerned an individual's place of birth. Questions 11a focused on mother's place of birth and 11b on father's place of birth. Each place of birth question requested the name of the island, the U.S. state, or the foreign country where a person or a person's parents were born, according to current political boundaries.

OPS staff responsible for data edits assigned a place of birth to those individuals who did not report this information — assigning the birthplace of another family member, or the birthplace of another person or parent with similar characteristics. Instead of allocating a specific foreign country to persons allocated as born outside the area of current residence, editors classified these individuals as "Born abroad, country or area not specified." The places of birth published in volume I of the 2005 census report were those most frequently mentioned by respondents.

Limitations. Because numerous changes in the boundaries of foreign countries have occurred over the past several decades, some persons may have reported their place of birth or their parents' place of birth in terms of boundaries that existed at the time of the birth or emigration, or in accordance with their own national preference. Apart from this minor problem, there are no obvious limitations in the 2005 census for place of birth data categories.

---

Comparability. Data on birthplace in the 2005 census are comparable to birthplace data collected in the 1980 and subsequent censuses. Similar data appeared in tabulations for those censuses. However, the 1980 census did not allocate non-response. Instead, the 1980 census reported these people separately in the tables as "Place of birth not reported."

#### *Citizenship*

Census questionnaire item 8 in 2005 dealt with citizenship, a question asked of all persons in the Republic of Palau. This question was similar to the question asked in the 1990, 1995 and 2000 censuses.

Because of Palau's political status, the 1990 census and subsequent censuses called persons born on Palau as "citizens of Palau." "U.S. citizens" were persons who responded that they were U.S. born, born in a U.S. Territory or Commonwealth, or foreign-born persons who were naturalized. The three categories of U.S. citizenship were: (1) born in the United States or a U.S. Territory or Commonwealth, (2) born elsewhere of U.S. parent or parents, and (3) U.S. citizen by naturalization. Persons "Not born in Palau and not a U.S. citizen" were foreign-born persons who were neither born in Palau nor citizens of the U.S.—including persons who had begun but had not completed the naturalization process at the time of the census.

Limitations. There are no apparent problems with data from the 2005 census on citizenship. Studies of previous censuses indicated that some persons undergoing naturalization reported themselves as citizens before attaining naturalized status, although this shortcoming was not evident in the 2005 data for Palau.

Comparability. The 2005 data can be compared to the 1990, 1995 and 2000 census data but not to the 1980 because citizenship was not asked in that Palau census.

#### *Year of Entry*

Questionnaire item 9 dealt with year of entry, asked of all persons who were born or resided outside Palau. These persons included U.S. citizens by birth (persons born in the U.S., Puerto Rico, CNMI, or another U.S. territory, or born abroad of American parents) as well as citizens of other nations. To avoid possible confusion concerning the date of entry of U.S. citizens by birth, this report uses the year a person came to Palau to stay rather than year of immigration. The 2005 census questions, tabulations, and census data products about citizenship and year of entry make no reference to immigration.

Limitations. The main limitation of the 2005 census data on year of entry concerns the duration of residence in Palau. The census used the phrase "to stay" to obtain the year in which a person became a resident of the republic. Although the questionnaire directed respondents to record the year they entered the area, it was difficult to ensure that respondents interpreted these guidelines correctly.

Comparability. The 1980 and subsequent censuses generally produced comparable data on year of entry. Instead of asking the actual year of entry, the 1980 census provided nine arrival times to be answered by the non-Palau born population.

#### *Residence in 2000*

This question was asked only to persons 5 years and older. For individuals who responded that they lived in a different house on April 1, 2005 than on April 1, 2000 (question 14a), the 2005 census asked for the island, U.S. state, or foreign country of residence on this earlier date (question 14b). The census also asked persons living in Palau on April 1, 2000 (but in a different house than April 1, 2005) the name of the hamlet in which they resided.

When an individual provided no information on residence in 2000, OPS data editors employed responses of other family members, if available, to assign a residence in 2000. Editors allocated individuals who did not respond or provided an incomplete response and had no obvious family members associated to the previous residence of other persons with similar characteristics who provided complete information.

The tabulation category "Same house" in the 2005 census included all persons aged five years or more who did not move during the previous five years, as well as those who moved but returned to their 2000 residence by census day, April 1, 2005. The category "Different house" in the census included persons who lived in Palau in April 2000 but in a different

housing unit than they occupied on census day 2005. The census then further subdivided these movers according to whether they previously lived elsewhere in Palau or outside Palau in 2000. The tables in this chapter present selected countries for persons who lived outside Palau in 2000, combining into the "Elsewhere" category individuals who resided in countries not listed.

Limitations. For the purpose of studying migration, the data category "Residence in 2000" provides inadequate data on multiple moves over the five-year period in question. In some cases, individuals who lived in the same house in April 2000 and April 2005 had moved in the interim. Similarly, persons who in 2005 lived in a different house than in 2000 may have made one or more intermediate moves.

Comparability. The 2005 Census question was similar to the question on the 1990, 1995 and 2000 censuses. The 1980 census asked similar questions about previous residence five years earlier, but did not allocate previous residence in the case of a non-response — recording these individuals in the category "Residence in 1975 not reported."

### *Ethnic Origin or Race*

Item 4 on the 2005 census questionnaire concerned ethnic origin or race. The question relied on self-identification and was open-ended. Ethnic origin or race refers to a person's origin or descent, including an individual's heritage or the place of birth of an individual's ancestors. Persons reported their ethnic group regardless of the number of generations removed from their place of ancestral origin. Responses to the ethnic origin question reflected the ethnic group with which persons identified and not necessarily the degree of attachment or association the persons had with a particular group.

Ethnic origin or race differs from other population characteristics often considered to show ethnicity, namely country of birth and language spoken at home. Most respondents reported their ethnic origin or race by specifying a single ethnic group, but some reported two, three, or more groups. OPS staff identified and coded the first two responses reported.

In published tabulations, the 2005 census designated multiple groups as general open-ended categories — like "Palauan and other group(s)"—rather than specific multiple ethnic groups like "Palauan-Filipino." Thus the census would include a person who reported "Filipino-Palauan" ethnicity in the "Palauan and other group(s)" category and the "Asian and other group(s)" category under "Multiple ethnic group."

Limitations. The ethnicity category incorporates the strengths and weaknesses of any open-ended question—the advantages of removing possibly undesirable constraints countered by the likelihood of receiving answers that are difficult to deal with or which do not make sense. OPS staff made every effort to impose a systematic coding scheme on the open-ended ethnicity data.

Comparability. The 1980 census was the first U.S. Census to contain an open-ended question on ethnic origin or race. Although the 1990, 1995, 2000 and 2005 censuses allowed respondents to report more than two ethnic groups, they coded only the first two. Although the 1980 census did not impute ethnic origin information, the 1990 and subsequent censuses did through the use of related data — parental birthplace and language, other members of the housing unit, or other persons in nearby housing units.

### *Legal Residence*

This question was asked of everyone, but tabulated for persons 18 years and older. The *legal residence* is the place where the person votes, or would vote if they were eligible to vote.

When an individual provided no information on legal residence, OPS data editors employed responses of other family members, if available, to assign a legal residence. Editors allocated individuals who did not respond or provided an incomplete response and had no obvious family members associated to the previous residence of other persons with similar characteristics who provided complete information.

Limitations. Only individuals actually enumerated in Palau reported legal residence, so anyone who votes in a specific Palau State but was away for schooling, the military, or a civilian job, but who would vote in an election in Palau, would not be included.

**Comparability.** The 2005 Census question was similar to the question on the 1995 and 2000 censuses. No other census asked for legal residence.

## Analysis of Migration Data

### Birthplace

Migration patterns in Palau started to change during the 1980s, with increasing Palauan emigration. By the late 1980s, a great counter-stream started as many Filipinos and other Southeast Asians started moving into Palau. Data on the birthplace of Palau residents show lifetime

Table 8.1. Birthplace of Palau Residents: 1980 to 2005

Birthplace	Population						Percent Change				
	2005	2000	1995	1990	1986	1980	2000-05	1995-00	1990-95	1986-90	1980-86
Total:	19,907	19,129	17,225	15,122	13,873	12,116	4.1	11.1	13.9	9.0	14.5

Sources: U.S. Bureau of the Census, 1984b, Table 20; 1992c, Table 36; OPS, 1987, Table A5, 1995, 2000 and 2005, Table 11.

migration (Table 8.1). Although about two-thirds of Palau's residents in 2005 were born in Palau, this group declined both in relative terms during the 1980 to 2005 period. The actual number of Palau-born in Palau increased by about 1,000 between 1980 and 1986, but then remained relatively constant until 2000, increasing by only 5000 during that period, but increasing by another 1,000 between 2000 and 2005.

Of the foreign born, the biggest gains were for Filipinos and "Other Asians". Only 126 persons born in the Philippines were living in Palau in 1980 compared to more than 3,000 Philippine born in 2005. Similarly, only 5 persons reported to be "Other Asia" born in 1980, but 1,359 were in this category in 2000, but decreasing to 903 in 2005. Two other groups – those born in the United States and those born in the CNMI – also showed large increases, but many of these persons were almost certainly Palauans whose parents bore them in these places, with the respondents later returning to Palau, and being counted in the Census; this phenomenon is becoming true throughout the Pacific Islands. The number of USA born increased from 56 to 377 over the 2 1/2 decades, and those born in the CNMI increased from 32 to 280. (See also Figure 8.1.)

Figure 8.1. Percent Palau-Born and Percent Non-Palau-Born, Palau and Koror: 2005

As noted, the influx of non-Palauans increased over the 25 years, yielding a Palau-born resident population in 2005 that was 24 percentage points lower in 2005 than 1980 – from 94 percent in 1980 to 82 percent in 1990 and only 67 percent in 2000 and 70 percent in 2005 (Table 8.2). That is, by 2005, Palau-born persons made up only 7 of every 10 people living in the Republic.

Despite migration from the CNMI, U.S., and other Pacific islands during the 1980s and 1990s, the greatest absolute increase in foreign-born individuals came from Asia. Persons born in the Philippines comprised the majority of foreign-born residents of Palau; their continued increase during the 1980s yielding a Philippine-born population in 1990 that was nearly 10 percent of the total. The percentage of the population being Philippines born increased to 15 percent in 1995, where it stayed in 2000 and 2005. “Other Asians” increased from about 1 percent in 1986, to 2 percent in 1990, doubled again to 4 percent in 1995, and almost doubled yet again in the next 5 years to about 7 percent in 2000, but dropping then to 4.5 percent in 2005. As is the case with the Koreans and Filipinos, most of these other Asians migrated to Palau for employment — primarily as blue-collar workers.

Since the 2005 census, like the 1990, 1995 and 2000 censuses, was not full a *de jure* census, it does not provide data on the emigration of Palauans, the other half of the mobility equation. In Chapter 16 we look at the statistics on Palau emigrants from various censuses and surveys. Palau-born individuals were certainly leaving the Republic, based on the number of persons remaining. Data in Table 8.1 and Table 8.2 show that the number of Palau-born persons increased slightly between 1980 and 1986, remained constant between 1986 and 1990, and then continued to increase slightly. Given the current natural increase found throughout most of Micronesia, including Palau (see Chapters 6 and 7), the growth during the early 1980s was nominal and the constant population from the late 1980s through the 1990s showed that many Palauans were emigrating. The two most likely destinations were Guam, where 1,201 Palau-born individuals resided in 2003, and the CNMI, with 1,507 Palau-born persons, based on a recent enumeration (see Chapter 16). Another probable destination is the United States. Ironically, Palauans leave their home islands for the same reasons that others migrate there: to get better employment or further their educations. Another reason for growing emigration is marriage to non-Palauans, a phenomenon that has accompanied growing interaction with individuals from other countries over the past few decades.

Migration patterns differed by sex (Tables 8.3 and 8.4). With few exceptions, men were more mobile throughout the period. Of the Palau-born residents of Palau, a greater proportion of women than men resided in the republic in all census years. For example, in 1980 about 87 percent of the male residents of Palau were born in the republic, compared to nearly 91 percent of the females; this decreased to 66 percent of the males and 74 percent of the females in 2005. The distributions for 2005 were similar to those of 1995 and 2000.

For males, the increases in Palau born were small between 1990 and 2000, but then jumped by more than 500 between 2000 and 2005, indicating both a baby boomlet (as seen in Chapter 6 on fertility) and some return migration of Palauans

who had previously left. The number of foreign-born males decreased between 2000 and 2005 after previously increasing throughout the period. The 989 non-Palau born males in 1986 were only 13 percent of the population; the 3,620 foreign-born males in 2005 were 1/3<sup>rd</sup> of the males in Palau in 2005.

Similarly, for the females, the number of Palau-born and foreign-born females increased continuously during the two decades, but the percent being Palau-born decreased from 91 percent in 1986 to only 74 percent in 2005. The absolute increase in Palau-born females was less than 1,000, while almost 2,000 more foreign-born females were in Palau in 2005 than in 1986. Throughout the period, Philippines-born females were the largest group of foreign-born females. (See Figure 8.2 below for percent distribution by states in Palau for 2005.)

Table 8.4. Birthplace of Palau Residents for Females: 1986-2005

Figure 8.2. Percent Not Born in Palau by State, Palau and Koror: 2005  
 Percent Not Born in Palau by State: 2005  
 Percent not Palau Born by Hamlet, Koror: 2005

The decline in the percentage of resident Palau-born males and females is consistent with the growing immigration of foreign-born persons and the growing emigration of native Palauans. With few exceptions, the data in Table 8.2 show that most immigrants to Palau were males — particularly from Japan, Korea, and the Philippines (as well as China and Taiwan, once again included in the "Other Asia" category). These differences between sexes ultimately may have important implications for the population composition of Palau, particularly if the emigration of Palauans and the immigration from other nations increases.

Table 8.5. Males per 100 Females by Birthplace: 1986-2005

Sources: OPS, 1987, Tables A1, A2, & A15; U.S. Census Bureau, 1992c, Table 36, 1995, 2000 & 2005 Census Table 60.

Table 8.5 shows the sex ratio for Palau's total population and for 5-year age groups. The sex ratio increased over the period, except for the 1995 census, and now 2005, as noted earlier. The sex ratio for Palau-born decreased over the 14 years, from 108 males per 100 females in 1986 to 106 in 1990 and 1995, to 104 in 2000 and 2005. The sex ratio for the non-Palau born, however, moved around, from 176 males for every 100 females in 1986 and 180 in 1990 to 145 in 1995, but back up to 162 in 2000 and 149 in 2005.

While the FSM born were among the most "male" in the 1980s, by 2000, every 100 FSM born females had only 80 counterpart males; this value increased to 95 in 2005. CNMI and FSM born

were the only sub-populations to have a sex ratio of less than 100 in 2005. In 2005, Palau had 461 Other Asia-born males for every 100 females, and 167 U.S.-born males for every 100 US-born females.

We have already noted selective immigration (and, by inference, selective emigration) by sex. Table 8.6 looks at Palau-born and Philippines born by age and sex from the 2005 census. As would be expected, at the youngest ages, the percentage of Palau-born people was high – 85 percent of the 0 to 14 years olds were born in Palau (compared to 70 percent of all residents), while only 2 percent of the 0 to 14 year olds were born in the Philippines.

Table 8.6. Age of Palau Residents by Birthplace (Palau and Philippines) and Sex: 2005

Age Group	Total for 2005			Males for 2005			Females for 2005		
	Total	Palau	Philippines	Total	Palau	Philippines	Total	Palau	Philippines
Total:	19,907	69.6	16.0	10,699	66.2	17.2	9,208	73.7	14.6
0 to 14 years	4,798	85.0	2.1	2,454	86.1	2.4	2,344	84.0	1.9
15 to 24 years	2,728	69.2	8.4	1,427	70.0	7.8	1,301	68.3	9.1
25 to 34 years	3,439	51.1	28.4	2,014	46.3	28.7	1,425	57.8	27.8

Source: OPS, 2005 Census, Table 72

The 15 to 24 year olds already started seeing the immigration, at the higher ages of this group – only 69 percent of that age group were born in Palau, while 8 percent of them had been born in the Philippines. But, in the “middle” age groups the immigration was most felt – only about half of the 25 to 34 year olds were born in Palau (compared to more than 1 in 4 born in the Philippines), and somewhat more than half of those 35 to 44 were born in Palau (compared to about 3 in 10 for Philippines born). In older ages, the percentages shifted back to being mostly Palau-born (although only 3 of every 4 persons 45 to 64 were born in Palau.)

Figure 8.3 provides a pyramid showing the age and sex distribution of the total population and the Palau-born population in the same graphic. The selective nature of the foreign immigration is readily apparent from the very pronounced jutting out at age groups 25 to 39. Figure 8.4 shows a similar set of pyramids for the 1995 census. Here, the jutting out is less pronounced, showing less differential immigration of the foreigners (or selective emigration of Palauans in various age groups, or both.)

Figure 8.3. Palau and Non-Palau Born by Age and Sex: 2005

Figure 8.3 Palau and Non-Palau Born: 2005  
Population by Age and Sex

Figure 8.4. Palau and Non-Palau Born by Age and Sex: 1995

Figure 8.4 Palau and Non-Palau Born: 1995  
Population by Age and Sex

As noted earlier, females were more likely to have been born and stayed in Palau than males. Less than half of the males 25 to 34 were born in Palau (and about half of those 35 to 44). More than half of the females 25 to 34 were Palau-born compared to about 1 in 4 being Philippines born. The trend, clearly, is towards increased emigration of Palauans in the early earning years, and increased immigration of Philippines and other Asia born.

Table 8.7 shows the vertical percentages for the same information. The patterns for males and for females were similar to the pattern for the whole population. While 29.4 percent of the Palau-born population was less than 15 years old, only 3.2 percent of the Philippines born fell in this category. The Palau-born showed a fairly regular distribution for the age distribution for a population experiencing a rapid fertility decline. And, the Philippines population showed a fairly typical pattern for an immigrant population – fewer younger people, and very few older people – although that is likely to change as Filipinos stay in Palau, marry and have families, and eventually retire here.

Table 8.7. Birthplace of Palau Residents (Palau and Philippines) by Age &amp; Sex: 2005

Age Group	Percentage for 2005			Males for 2005 in Percentage			Females for 2005 in Percentage

Source: OPS, 2005 Census, Table 72

Migration to Palau varied substantially by State (Table 8.8). Of the 16 states in the republic, two contained the vast majority of persons born elsewhere in 2005, namely Koror and Airai. In addition to containing about 70 percent of Palau's total 2005 population, Koror State also provided the greatest employment in the republic—both private sector and government. Moreover, the majority of housing, educational institutions and most modern amenities were located in this state. Nearly 18 percent of Philippines-born individuals residing in Palau in 2005 lived in Koror, along with the majority of individuals born in the U.S. or a U.S. Territory (about 5.3 percent of all these individuals in Palau) and most persons born "Elsewhere" (roughly 8.6 percent of the total). Airai, the second most populated state in Palau in 2005, contained the second greatest number of residents born outside. The remaining states in Palau contained relatively few individuals born outside.

## PARENTAL BIRTHPLACE

Parental birthplaces give information about generational migration, the movements of one generation followed by the next. This information is useful for planning, as the government is able to see movements between States of Palau, and into (and sometimes out of) Palau altogether. Data on father's birthplace by State, for example, in general agreed with the data on individual's birthplace by state. Of the residents of Palau in 2005, more than 68 percent were born to fathers also from Palau (Table 8.9). About 17 percent of the residents had fathers born in the Philippines, with the remainder born in the U.S. or a U.S. Territory, or elsewhere (probably somewhere in Asia). Once again, Koror State contained the greatest number of residents with fathers born elsewhere, primarily the Philippines. Airai was a distant second to Koror State in the number of fathers born outside Palau, with the other states accounting for the relatively few remaining foreign-born fathers.

Table 8.8. Birthplace of Palau Residents by State: 2005

Similarly, about 71 percent of the Palau residents in 2005 had mothers born somewhere in the republic (Table 8.10). Of those mothers born elsewhere, about 17 percent came from the Philippines. However, compared to the birthplaces of fathers, fewer mothers of Palau residents in 2005 came from the Philippines, the U.S. or one of its territories, or elsewhere. As discussed above, in 2005 more male residents of Palau were born outside the republic than female residents. This difference between father's and mother's birthplace probably is due to a larger number of non-Palauan males immigrating to the republic and fathering children with Palauan women.

## Citizenship

Data on the citizenship of Palau's population in 2005 were consistent with the general migration patterns seen in place of birth. For the republic as a whole, more than two-thirds of the 2005 residents were born in Palau (about 70 percent) and hence were designated citizens of the republic (Table 8.11). An additional 141 people in Palau in 2005 claimed to be Palau citizens by naturalization. The majority of the remainder, born neither in the U.S. nor Palau, mostly comprised the Asian community that increased in Palau over the past two decades. At the level of individual states, with the exceptions of Airai and Koror most residents were citizens of Palau. These two states contained the greatest numbers of persons born in the U.S. or its territories, as well as those who were citizens of some country other than the U.S. or Palau. Once again, the large numbers of foreigners in Airai and Koror states reflect primarily the greater economic and educational attraction of these two jurisdictions, as well as the presence of modern amenities (particularly in Koror State). The presence of national government offices in Koror provides an additional attraction to non-Palauans, particularly other foreign government embassies, consulates and regional offices that provide an interface between their governments and the government of Palau.

Source: OPS, 2005 Census, Table 61

Immigration to Palau increased dramatically during the 1980s and 1990s. However, between 2000 and 2005, the trend reversed (Table 8.12). About 2/3rds of the population was born in Palau, but this was a greater percentage than in 2000 (although until 2000, the percentage of

Palau born decreased, as shown previously. The large majority of the actual migrants arrived after 2000, as seen in the table, but many also left, and this is not shown in the table. (See Figure 8.5 below).

Figure 8.5. Percent of Foreign Born Migrating to Palau, Palau and Koror: 2003-2005:2005

Percent of Foreign Born Migrating to Palau during 2003 to 2005: 2005

Percent of Foreign Born Migrating 2003-2005 by Hamlet, Koror: 2005

Table 8.12 also presents information on year of immigration by age. These data once again show that much of the recent immigration to Palau has been for purposes of employment. Most individuals who moved to the republic were between 20 and 54 years old in 2005, yielding an age distribution that contrasts dramatically with that of Palau-born. The natural aging process requires focusing specifically on the most recent immigrants when examining the age of migrants. Those who migrated many years prior to the 2005 census would have aged between the year they moved and the year of the census, resulting in an older age composition—an effect partially reduced in cases when people return to their home countries as they grow too old to work. Although recent immigrants to Palau included several individuals younger than 20 years of age, most of these individuals probably were offspring of those who came for employment. Some of the non-Palau born residents aged 15 to 24 years were students at Palau Community College in Koror. Some of the non-Palau born persons belonging to older working age groups could be Peace Corps volunteers, Civil Action Team members, and businessmen. Many of this age group also may have been Asian (and non-Asian) contract workers who married Palauans and began families, with many of the remainder employed by the Palau national government.

Source: OPS, 2000 Census, Table 61

For purposes of comparison, Table 8.13 presents data on year of immigration by age for 2000. The most obvious trend in tables 8.12 and 8.13 is the very large amount of recent immigration. In 2000, about 3 in every 4 foreign born persons migrated in the five years before the census, down from 4 in 5 in 1995. Most of the migrants were working age.

Increased immigration over time also held for most states in Palau (Table 8.14). About 7 in every 10 of Palau's residents in 2005 were born in Palau, as noted, an increase from 2000. Hatohobei had no foreign-born persons at all, so no year of entry information. About 3 in every 10 of the immigrants arrived in the year before the census, and about half of all the immigrants arrived within the 5 years before the census. Very few arrived before 1990. The immigration was seen for Koror and Airai, the states with the largest number of non-Palau born residents. The numbers of immigrants to other states were too small to say much.

## Residence in 2000

Although data on birthplace focus on long term, or lifetime, mobility patterns, the 2005 census also collected data on short-term mobility. Table 8.15 presents the data on Palau residents by place of residence in 2000, necessarily excluding those individuals aged less than five years. Of the remaining 2005 residents, about 1 in every 3 did not live in the same house in 2000 as in 2005. Many of these individuals (about 10 percent of the total 5 years and older) resided in a different house within the same state, or in a different part of Palau. Others resided outside the republic (20 percent of the total), mostly in Asia (about two-thirds of those not living in Palau.). In 2005, Koror State contained the majority of the individuals who in 2000 lived somewhere other than the same house—about 40 percent of all these persons in Palau (way down from 70 percent in 2000 based on the 1995 residence and 80 percent for 1985 in the 1990 census, although not shown here). More and more people are moving between states, and not just to Koror, any more. Although these individuals included persons who migrated from other countries, they also included persons who migrated to Koror from more rural portions of Palau. (See distribution by state in Figure 8.6 to 8.7a below)

### Ethnic Origin or Race

Data on ethnicity support the other information on mobility discussed in this chapter. Most of the residents in Palau in 2005 considered themselves Palauan (Table 8.16). Of the remainder, most were Filipino, followed by "Other" which included the large non-Filipino Asian population that migrated to Palau after 1980. Relatively few residents of Palau in 2005 considered themselves Carolinian, while fewer still considered themselves "White." Most persons of non-Palauan ethnicity resided in Koror and Airai states, with Filipinos again largest. Figure 8.8 and 8.8a below shows the distribution of persons of Palauan ethnicity by states of Palau and hamlets of Koror for 2005.

Table 8.16. Ethnic Origin of Palau by State: 2005

Figure 8.8. Percent Palauan Ethnicity, Palau and Koror: 2005

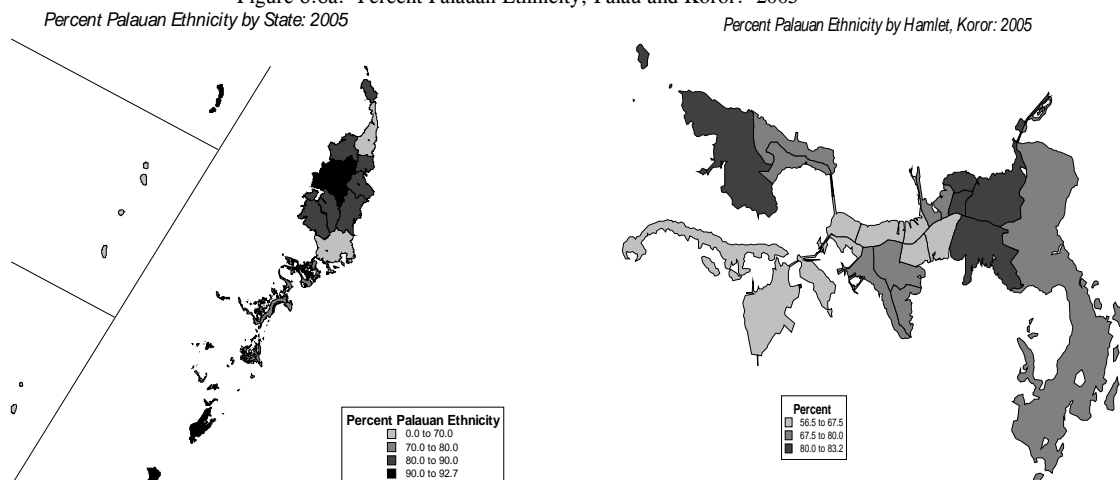

Figure 8.8a. Percent Palauan Ethnicity, Palau and Koror: 2005

Data on ethnicity by age in 2005 reveal differences between Palauans and non-Palauans (Table 8.17). Since about 3 out of every 4 residents were Palauan, the total population and the Palauans were younger than the immigrants. Generally, each older 5-year age group was smaller than the preceding one. However, the non-Palauans showed the type of distribution usually seen among newly arrived immigrant groups — the five-year age groups between 20 and 49 years were larger than the younger and older groups. Also, the median age of the non-Palauans was more than 5 years older than that of the Palauans, down from a difference of 9 years in 2000.

Table 8.17. Population by Age and Ethnicity: 2005

5-Year Age Groups	Population by Ethnicity			Percent			Percent Palauan
	Total	Palauan	Non-Palauan	Total	Palauan	Non-Palauan

Source: 2000 Census, Table 59

We can compare the recent changes in ethnicity, and whether the government's stated goal of reducing reliance on foreign workers by comparing ethnicity in 2000 with 2005 (Table 8.18). The percentage of non-Palauans decreased from 30.1 percent in 2000 to 27.5 percent in 2005. In absolute numbers, the decline was from 5,765 to 5,469 non-Palauans, a decrease of about 300 people.

The non-Palauan population decreased by the returning of dependents of non-Palauans whose income did not meet the level set by the National Congress of \$15,000, and also by the closing down of the garment factories and the subsequent departure of the workers.

## LEGAL RESIDENCE

Finally, the 2005 Census asked for each person's legal residence. To show the potential voting population based on the 2005 Census, table 8.19 shows the distribution of the self-defined legal residence for people 18 years and older in the 2005 Census. About 65 percent of the resident population considered themselves legal residents of Palau (and hence, 35 percent of the adults did not consider themselves legal residences for voting purposes.) Of those, 5,643, or about 61 percent were living in the same state as their legal residence. These percentages did not change very much from the 2000 Census. For Koror, about 47 percent of Palau legal residents living there also voted there, down from 52 percent in 2000. This phenomenon has implications for public – social and educational – services, and the relationship between the National government and the State governments. About 70 percent of those in Airai vote in that State, the other 30 percent vote in other States. On the other hand, 96 percent of those living in Peleliu vote there.

## Conclusions:

The 2005 Census data describe a population increasingly affected by both immigration and emigration. Most information in the recent census deals with the former topic. Although this chapter employs several means of assessing immigration and internal migration, much of the story is told by place of birth of republic residents. Nearly 1/3<sup>rd</sup> of the 2005 population of Palau were born elsewhere, mainly in the Philippines or another country in Asia (primarily China, Japan, Korea, or Taiwan). This very rapid immigration started about 1980 and has been increasing over time. In general, more men than women moved to Palau during the 1980s and 1990s, both sexes having large numbers aged 25 to 44 years. The main reason for this immigration was the search for employment, as Filipinos and other Asians moved to Palau for work — often taking menial jobs.

In addition to place of birth, this chapter also discussed citizenship, year of entry, residence in 2000, and ethnic origin or race as means of assessing migration in Palau. In all cases, substantial recent migration of working age persons from Asia, particularly the Philippines, is evident. Evidence for short-term migration is particularly noteworthy; in contrast to other parts of Micronesia where large-scale immigration decreased in recent years (see Gorenflo, 1990), mobility remains a substantial force even over the short term in the Republic of Palau.

Since the 2005 census was modified *de jure*, data on emigration from Palau were not collected. However, in Chapter 16 we look at many of the emigrants – at least, for those in Guam and the CNMI. When we look at birthplace of Palau residents, and their fertility and mortality, we find that the sustained growth of native Palauans that *should* have characterized the 1980s and 1990s did not occur. Palauans migrated elsewhere. Data from the 1990 censuses of the CNMI and Guam showed relatively many residents born in Palau, probably accounting for most of the emigrants from the republic. By 2000, many Palau emigrants were also going to Hawaii and the U.S. Mainland.

---

## CHAPTER 9. EDUCATION AND LANGUAGE

Educational statistics from Palau's censuses yield information on the school enrollment and levels of educational attainment. Also, census data on language use provide information for use in bilingual programs in schools and the work place. Generally, a population's levels of formal schooling and language use are good indicators both of social conditions and potential for economic success. For Palau, which is moving from a more traditional economic system to a more Westernized system, data on education and language serve the additional purpose of providing means to evaluate overall cultural change. Moreover, given the important role that education has come to play in various sectors of Palau's economy, and the role of language use in the work place, the study of these two subjects should give insights on the direction of acculturation and the changing economic potential of the republic.

The 2005 census, like the 1990, 1995 and 2000 Censuses, had two items for education: school enrollment and level of educational attainment. The Palau Department of Education collects statistical data annually to obtain information about school enrollment and to assess needs for special programs in bilingual education and special education. Palau's censuses allow more in-depth analysis of the school population's ethnicity, birthplace, and class of worker, income, and language spoken at home. Here we examine education and language data from the 2005 census.

### Data Description

#### *SCHOOL ENROLLMENT AND TYPE OF SCHOOL*

The 2005 census obtained data on school enrollment from answers to questionnaire item 12. Persons were classified as enrolled in school if they reported attending a "regular" public or private school or college at any time between February 1, 2005 and enumeration. The question included instructions to "include only pre-kindergarten, kindergarten, elementary school, and schooling which would lead to a high school diploma or a college degree" as regular school. Palau census office personnel instructed enumerators not to include enrollment in a trade or business school, company training, or tutoring unless the course would be accepted for credit at a regular elementary school, high school, or college. Persons who did not answer the enrollment question were assigned the enrollment status and type of school of a person with the same age and sex whose residence was in the same or a nearby area.

*Public and Private School.* This category included persons who attended school in the reference period and reported as enrolled by marking one of the questionnaire categories for "public school, public college" or "private school, private college." The enumerator instructions defined a "public" school as "any school or college controlled and supported by a local or Palau National or State Government." The census defined "schools supported and controlled primarily by religious organizations or other private groups" as "private."

*Level of School in Which Enrolled.* The 2005 census classified persons enrolled in school at the time of the 2005 census as enrolled in "preprimary school," "elementary school," "high school," or "college" according to their response to question 13a (years of school completed or highest degree received). Persons who were enrolled and reported completing pre-kindergarten school or less were classified as enrolled in "preprimary school," which included kindergarten. Similarly, enrolled persons who had completed at least kindergarten, but not eighth grade, were classified as enrolled in elementary. Persons who completed at least the eighth grade, but who were not high school graduates, were classified as enrolled in high school. Enrolled persons who reported completing high school or some college or having received a post-secondary degree were classified as enrolled in "college." Enrolled persons who reported completing the twelfth grade but receiving "No Diploma" were classified as "enrolled in high school." For more information on level of school, see the discussion for *Educational Attainment*.

Limitations. There are no obvious limitations of the school enrollment and type of school data collected in the 2005 census of Palau.

Comparability. School enrollment questions have been included in Palau's censuses since 1970. The pertinent question in the censuses referred to attendance "since February 1". Two exceptions occurred. In 1980, the census was conducted on September 15, 1980, so the reference used was "Since September 1, 1980...". Similarly, in 1995, the census was collected as of September 9, 1995, so an education reference date of September 1, 1995 was used. The 2000 and 2005 censuses took place as of April 1, so the February 1 date was used again.

The age range for which enrollment data have been obtained and published has varied between censuses. Information on enrollment was recorded for persons aged 3 years and over in 1980 and subsequent censuses. In these same censuses, college students were enumerated where they lived while attending college.

Type of school was first introduced in the 1980 census in Palau, where a separate question asked the enrolled persons whether they were in a "public" or "private" school. Grade of enrollment was first available in Palau's 1980 census where it was obtained from responses to the question on highest grade of school completed. Enumerators were instructed that "for a person still in school, the last grade completed will be the grade preceding the one in which he or she was now enrolled." In 1980, grade of enrollment was obtained from the highest grade attended in the two-part question used to measure educational attainment. For more information on grade of enrollment, see the discussion under *Educational Attainment* below.

Data on school enrollment are also collected and published by other Republic of Palau and other foreign government agencies. Where these data are obtained from administrative records of school systems and institutions of higher learning, they are only roughly comparable with data from population censuses and household surveys because of differences in definitions and concepts, subject matter covered, time references, and enumeration methods. At the local level, the difference between the location of the institution and the residence of the student may affect the comparability of census and administrative data. Differences between the boundaries of school districts and census geographic units also may affect these comparisons.

#### *SCHOOL ENROLLMENT AND LABOR FORCE STATUS*

The tabulation of 2005 census data on enrollment, educational attainment, and labor force status for the population 16 to 19 years old allows for calculation of the proportion of the age group who were not enrolled in school and not high school graduates or "dropouts" and an unemployment rate for the "dropout" population. Definitions of the three topics and descriptions of the census items from which they were derived are presented under the headings *Educational Attainment*, *Employment Status*, and *School Enrollment and Type of School*. The tabulations published in Volume I of the 2005 census report for Palau included both the civilian and Armed Forces populations (although no Armed Forces persons were enumerated), but labor force status is provided for the civilian population only. Therefore, the labor force statuses may not add to the total lines high school graduate and not high school graduate; the difference is Armed Forces.

Limitations. There are no obvious limitations of the school enrollment and labor force data collected in the 2005 census of Palau.

Comparability. The tabulation of school enrollment by labor force status prepared for the Volume I report of the 2005 census of Palau is similar to that published in 1980 and subsequent census reports (see U.S. Bureau of the Census, 1984; 1992c). The 1980 census tabulation included a single data line for Armed Forces. However, enrollment, attainment, and labor force status data were shown for the civilian population only.

#### *EDUCATIONAL ATTAINMENT*

The 2005 census of Palau obtained data on educational attainment from answers to questionnaire item 13a. Data were tabulated for persons 3 years old and over. Persons were classified according to the highest grade of school completed or the highest degree received. For persons currently enrolled in school, the question included instructions to report the level of the previous grade attended or the highest degree received. The question included response categories that allowed persons to report completing the twelfth grade without receiving a high school diploma. Respondents were to report as "high school graduate(s)" those persons who received either a high school diploma or the equivalent—including, for example, individuals who passed the Test of General Educational Development (G.E.D.) and did not attend college.

Enumerators were instructed that schooling completed in foreign or un-graded school systems should be reported as the equivalent level of schooling in the regular school system; that vocational certificates or diplomas from vocational, trade, or business schools or colleges were not to be reported unless they were college-level degrees; and that honorary degrees were not to be reported. The instructions gave "medicine, dentistry, chiropractic medicine, optometry, osteopathic medicine, pharmacy, podiatry, veterinary medicine, law, and theology" as examples of professional school degrees, and specifically excluded "barber school, cosmetology, or other training for a specific trade" from the professional school

---

degree category.

OPS census personnel assigned persons who did not report educational attainment the attainment of a person of the same age and sex who resided in the same or a nearby area.

*High School Graduate or Higher.* This category included persons whose highest degree was a high school diploma or its equivalent, persons who attended college or professional school, and persons who received a college, university, or professional degree. Persons who reported completing the twelfth grade but not receiving a diploma were not included.

*Not Enrolled, Not High School Graduate.* This category included persons of compulsory school attendance age or above who were not enrolled in school and were not high school graduates; these persons may be taken to be "high school dropouts." There is no restriction on when they "dropped out" of school, and they may have never attended high school.

"Percent high school graduate or higher" and "Percent bachelor's degree or higher" are summary measures which can be calculated from the present data and offer quite readily interpretable measures of differences between population subgroups. To make comparisons with data from previous censuses, one can calculate "Percent high school graduate or higher" and approximate "Percent bachelor's degree or higher."

Limitations. There are no obvious limitations of the educational attainment data collected in the 2005 and subsequent censuses of Palau.

Comparability. Beginning in 1980, censuses of Palau included educational attainment questions on years of school completed. In the 1980 census, a two-part question asking highest grade of school attended and whether that grade was finished was used to construct highest grade or year of school completed. For persons who had not attended college, the response categories in the 1990, 1995, 2000 and 2005 censuses, the educational attainment question should have produced data comparable to data on highest grade completed from earlier censuses.

The response categories for persons who attended college were modified from earlier censuses because there was some ambiguity in interpreting responses in terms of the number of years of college completed. For instance, it was not clear whether "completed the fourth year of college," "completed the senior year of college," and "college graduate" were synonymous. Research conducted shortly before the 1990 census suggests that these terms were more distinct in 1990 and later than in earlier decades, and this change may have threatened the ability to estimate the number of "college graduates" from the number of persons reported as having completed the fourth or a higher year of college. It was even more difficult to make inferences about post-baccalaureate degrees and "Associate" degrees from highest year of college completed. Thus, comparisons of post-secondary educational attainment in this and earlier censuses should be made with great caution.

#### *LANGUAGE SPOKEN AT HOME AND FREQUENCY OF LANGUAGE USAGE*

Data on language spoken at home came from answers to questionnaire item 16. These questions obtained the range of languages other than Palauan spoken at home and how frequently they were spoken relative to Palauan. The questions were asked only of persons 5 years old and over.

*Language Spoken at Home.* Persons were asked in questionnaire item 16a whether they spoke a language other than Palauan at home. Respondents were not to include languages spoken only at school or languages for which the ability was limited to a few words or slang. Persons who spoke only Palauan at home were instructed to answer "No" and to skip the remainder of the language questions.

Those persons who reported speaking a language other than Palauan were asked in question 16b to report the non-Palauan language spoken at home. If more than one non-Palauan language was spoken, the person was asked which language was spoken most often. If it could not be determined which was spoken most often, the first language the person learned to speak was to be recorded. The response was written on the form by the enumerator and later given a three-digit code in a separate operation. Answers were coded using a detailed list of languages. If more than one language was written on the form only the first non-Palauan language was coded.

*Frequency of Language Usage.* Persons who reported in 16a that they spoke a language other than Palauan at home were

asked to report in item 16c the frequency with which they spoke the other language relative to Palauan in one of the following categories: "more frequently than Palauan," "both equally often," "less frequently than Palauan," or "does not speak Palauan." The imputation procedure for persons who failed to report language spoken involved attributing the language of other household members. If that was not possible, the language of a person of the same ethnic origin and other demographic characteristics was imputed. Unreported frequency of use was allocated in a similar manner.

**Limitations.** There are no obvious limitations of the language spoken at home and frequency of language usage data collected in the 2005 census of Palau.

**Comparability.** Questions concerning language spoken at home and frequency of language usage were asked for the first time in the 1980 census. The language categories included in the main report for the 1990 census of Palau were slightly different than those published in 1980, and in 1995, 2000 and 2005, "Palauan" rather than "English" was used.

### Analysis of Education and Language Data

Although the population of Palau increased from less than 12,000 in 1970 to more than 19,900 in 2005, the number of persons attending school in the republic remained virtually constant over the first two decades, even in 1995, before increasing by about 500 before 2000, and another 500 before the 2005 count (Table 9.1 and Figure 9.1). In part these contrasting trends were due to increasingly likelihood of staying in school to get better jobs or to join the military after graduation. Enrollment increased from 4,119 in 1990 and 4,178 in 1995, before increasing more rapidly to 4,543 in 2000, and 5,017 in 2005.

Table 9.1. School Attendance by Type and Level: 1990, 1995, 2000 and 2005

Figure 9.1. Persons 3 years & over enrolled in school: 1990 to 2005

Much of the earlier increase in enrollment probably was due to historic circumstances—the return of many administrators with school age children as the TTPI government closed down in Saipan, increased fertility, and selective migration patterns. Some of these same trends began to reverse in the 1980s, with the flow from Saipan stopping, fertility declining, and Palauan families and individuals emigrating. Then, with return migration, and more importantly, immigration, and the baby boomlet, enrollments started to increase again in the 1990s and continued in the 2000s.

The percentage of students in private schools showed a decline for preprimary students, then an increase after 2000; a slight increase between 1990 and 1995, followed by a decrease to 2000 for elementary school students, and an increase between 2000 and 2005; and a large increase of 12 percentage points between 1990 and 1995 for high school students, followed by a leveling off. This big increase for high school students was because of the smaller numbers going to public school, since those in private school stayed at about the same level.

Male students outnumbered female students in 1995 and 2000, but by 2005 slightly more females than males were enrolled (Table 9.2 and Figure 9.2 and Figure 9.3). In 2005, males slightly more likely to be enrolled in

levels of schooling between 1990 and 2000, except for college levels between 1995 and 2000 (Table 9.3)<sup>4</sup>. This last decrease could be because of selective immigration of less academically educated workers. The trends continued in the 2005 census. As of 1990, nearly 58 percent of the persons in Palau aged 25 years and over had attended four years of

<sup>4</sup> Cumulative percents are obtained by summing the percents in categories from the highest level to the lowest. Hence, if 10 percent of the population was reported as "college 4 years and above" and 19 percent are reported as "college 1 to 3 years", then the cumulative percent is 29 percent for persons in categories "college 1 to 3 years" and above. Similarly, cumulative for "high school and above" includes all persons who also reported some college. The bottom category – in this case "no education" – includes everyone with "no education" and all those with education, which is everyone else, and so is shown as 100 percent since everyone is included.

high school. About 31 percent of Palau residents had attended college, with more than 10 percent having at least four years of college. In 2000, the percentage being college graduates was about the same, at 1 in 10 of adults 25 years and over, and the percentage of high school graduates continued to increase – from 58 percent in 1990 to 74 percent in 2000. Also, the percentage who had at least attended high school also increased considerably, from 71 percent in 1990 to 85 percent in 2000 – partly a result of almost universal education in Palau itself. Again, the percents did not change very much in 2005, with a slight increase in those with elementary school education or more, and a slight decrease in college educated. (See Figures 9.4 to Figure 9.4d below)

Figure 9.4. Percent High School Graduate by Birthplace; Percent College Graduate, Palau: 2005

Figure 9.4a. Percent of Population 25 years and over being High School Graduates, Palau and Koror: 2005

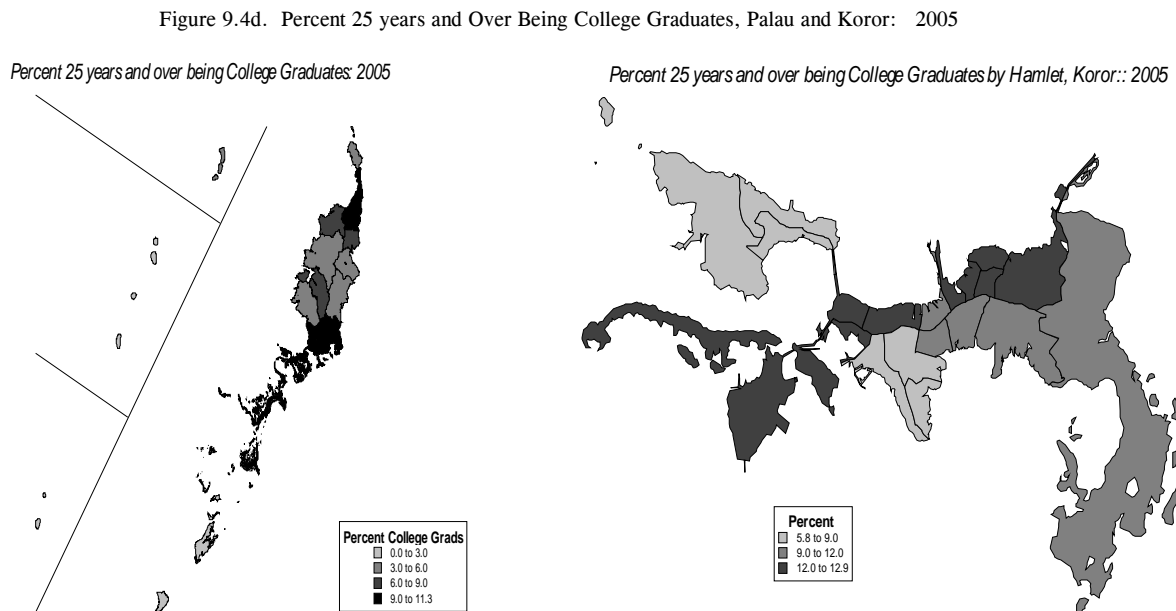

In general, educational attainment for males showed the same patterns as for the total population. The percentage of adult males being high school graduates increased from 62 percent in 1990 to 77 percent in 2005, and increase of 15 percentage points, similar to the increase for females – although the increase, from 52 to 71 for the females was slightly greater, a smaller percentage of females than males finish high school. About the same percentage of males as females, however, complete 4 years or more of college – percentages that increased in 1995, but returned to their 1990 levels in the 2005 census, again, probably because of selective immigration.

Figure 9.4b. Percent of Population 25 years and over being College Graduates, Palau and Koror: 2005

Although not shown in the tables, because Koror is the capital of Palau with the majority of private and government activities, persons living there were better educated than those living elsewhere. Koror State attracted more educated persons than other states in Palau, primarily because of the presence of high paying jobs requiring skilled persons. Koror also contained more educational institutions than other states in Palau, providing both more opportunity for formal

schooling and (at least for college education) introducing the greater likelihood that respondents actually were in Koror to pursue higher education. Rural states, in contrast, provided fewer educational opportunities as well as fewer economic and social attractions to those with formal educations elsewhere. Many persons with college degrees in 2005 living in rural parts of Palau were schoolteachers, government employees or international volunteers organizations.

*Educational Attainment by Age.* In 2005, 3 out of every 4 persons living in Palau and aged 25 years or older had attended some high school. As age increased, the percentage of all individuals claiming a particular level declined (Table 9.4). Less than 2 percent of all residents in Palau aged 25 years or more had education beyond that of a Bachelor's degree. Educational attainment varied considerably with age. For all levels of attainment except elementary school and high school non-graduates, the percentages increased by age to the 45 to 54 year age group, and then decreased.

Table 9.4. Educational Attainment by Age: 2005

Educational Attainment	Total	25 to 34 years	35 to 44 years	45 to 54 years	55 to 64 years	65 years & over

Higher degree	2.0	1.4	1.5	2.7	4.2	1.0

Source: OPS, 2005 Census, Table 66.

The percentage of high school graduates showed a direct decrease with age, going from 77 percent for those 25 to 44, to 76 percent for those 45 to 54, and then down to 64 percent for those 55 to 64 and 20 percent for those 65 years and over. College graduation does not show the same trend – while 11 percent of those 45 to 54 and 18 percent of those 55 to 64 were college graduates, less than 9 percent of those 35 to 44 and only 7 percent of younger adults were college graduates. For the youngest, this figure may have been influenced both by persons being away in school, taking longer than in the past to finish schooling, and the effects of the immigrants on the education statistics.

Recent immigration of less educated individuals to Palau, coupled with the emigration of better educated Palauans to Guam, the CNMI, and the U.S., probably has led to declining levels of educational attainment, particularly among youngest age groups. Migration could explain some of the decline in the proportion of individuals with Bachelor's degrees for younger people.

Educational attainment in 2005 for males in Palau exceeded the attainment of all persons at all levels of schooling except Some College and Bachelor's for females (Table 9.5 and Table 9.6). The patterns for all persons aged 25 years and older held for males as well. The decline in the proportions of males with Bachelor's degrees between age groups 25 and 44 years is particularly noticeable. Immigration of working age males to Palau was particularly heavy during the 1980s and 1990s and accounted for some of the decline in the proportion of males with Bachelor's degrees in the youngest two age groups; return of the migrants also affected the rates.

Table 9.5. Educational Attainment by Age for Males: 2005

Unlike in previous census years (see the 2000 Census monograph), females had higher educational attainment as almost level than the. Male and female patterns were similar. In addition, differences in the level of educational attainment seen by sex were particularly evident for individuals in the three oldest age groups.

### *Educational attainment by birthplace.*

Two of the processes influencing the declining educational attainment in Palau are the emigration of Palau-born and the immigration of non-Palau born. Many of these differences emerge in the comparison between persons born in Palau and those born elsewhere, particularly the Philippines, the latter representing the main source of immigrants to Palau (Table 9.7).

Table 9.7. Cumulative Percents of Educational Attainment by Birthplace, 25 years &amp; over: 2005

Educational Attainment	Total	Palau	U.S. or Territory	FSM	Philippines	Other Asia	Others
Total, 25 + years:	12,381	7,897	256	197	2,846	973	212

Source: OPS, 2005 Census, Table 79.

Although not shown here, in 1990, each level of educational attainment contained proportionally more individuals born in the Philippines—thus depicting a relatively well-educated immigrant population. The most dramatic cases of Philippine-born individuals having more education than Palau-born persons concern those with at least 4 years of high school. For example, although slightly less than 16 percent of Palau's 1990 adult population was born in the Philippines, nearly 28 percent of all individuals with 4 years of high school and no diploma came from this country. The only individuals with more than 4 years of high school underrepresented among Philippines-born persons were those with associate degrees and those with graduate or professional degrees. In contrast, the only Palau-born persons represented in a level of educational attainment in excess of their proportion of the republic's population are those with 2 years of high school or less and those with an associate occupational degree.

As Table 9.7 shows, the situation changed drastically by 2005. Although Philippines born had a larger proportion of high school graduates – about 8 of every 10 adults compared to less than 2 of every 3 of Palau-born, by the college graduate level, Palau-born passed the Philippines born. Also, while 1.7 percent of the Palau-born had Master's degrees, this was true for only .4 percent of the Philippines born.

Since the lower age limit for educational attainment used currently is often 18 years rather than 25 years, Table 9.7a shows the same information for people 18 years and over. The results are similar. About 65 percent of the Palau born were high school graduates compared to 70 percent of the total population, and 8.0 percent of the Palau born were college graduates compared to 8.4 percent of the total population.

Table 9.7a. Cumulative Percent of Educational Attainment by Birthplace, 18 years &amp; over: 2005

Educational Attainment	Total	Palau	U.S. or Territory	FSM	Philippines	Other Asia	Others
Total, 18 + years:	14,154	9,063	355	326	3,067	1,086	257
Elementary School	100.0	100.0	100.0	100.0	100.0	100.0	100.0

Higher degree	1.7	1.5	13.2	0.9	0.4	3.0	4.7

Source: OPS, 2005 Census, Table 102.

United States-born people, including some people of Palauan ethnicity who were born in the U.S. but later returned to Palau contributed the highest educational levels – 39 percent had at least Associates degrees, and 30 percent were college graduates. More than 13 percent of those born in the U.S., Guam, CNMI, or another territory, had Master's degrees. Palau is exerting a positive pull (for the Republic of Palau) of other Freely-Associated States workers. More than 14 percent of the FSM and Marshalls born people 18 years and over had Associates degrees, and 4 percent had Bachelor's degrees.

*Educational attainment by occupation.* In 2005, about 78 percent of all employed persons aged 25 years and over were high school graduates, with more than 21 percent having at least a B.S. or B.A. degree (Table 9.8). Levels of educational attainment varied among occupations. For instance, relatively high percentages of all individuals with managerial and professional occupations had at least a high school education. Also, high proportions of persons with these occupations had Bachelor's degrees or more. Although the individuals employed in technical, sales, and administrative support were more likely to have a high school education than the population as a whole, they were less likely to have at least a Bachelor's degree than the managers. For the remaining four occupations, persons were less likely to claim either level of educational attainment than found in the entire employed population (except for those in precision production, crafts and repairs with an equivalent percent high school graduates to the whole population).

Table 9.8. Educational Attainment by Occupation, 25 years &amp; over: 2005

Occupation	Total	High School Graduate (%)	College Graduate (%)	Male	High School Graduate (%)	College Graduate (%)	Female	High School Graduate (%)	College Graduate (%)
Employed 25 years & over:	9,019	78.3	20.6	5,532	76.4	18.1	3,487	81.3	24.6

Source: OPS, 2005 Census, Table 123

The columns for employed males in Palau show they were less likely to have either a high school education or a Bachelor's degree than the total population. However, these differences did not hold for all occupations. For instance, proportionally more males employed in technical, sales, and administrative support positions had a Bachelor's degree than the total population. In general, proportionally more males in most occupations had at least a high school diploma than in those occupations for all employed persons. Males employed in managerial and professional occupations, as well as those employed in technical, sales, and administrative support occupations, tended to have higher levels of educational attainment than all males.

Employed females in Palau had proportionally higher educational attainment in 2005, both at the high school and college levels, than employed males. However, comparisons of formal education varied among occupations. Female managers and professionals were more likely than their male counterparts to be high school or college graduates. But although female technicians, sales, and administrative support workers were more likely to be high school graduates, males in these occupations were more likely to be college graduates. Females in the remaining occupations tended to have less formal education than the males.

*Educational attainment by class of worker.*

In 2005, government employees were more likely to be college graduates than private sector employees (Table 9.9). Part of this difference probably relates to the contrasting work in the public and private sectors. Although in 1990, employed adults working for the federal government were more likely to have high school diplomas than other workers, by 2005 private sector workers were actually more likely than government workers to have high school diplomas. But, almost 16 percent of government workers had Bachelor's degrees compared to only 7 percent of the private sector workers. And, 4 percent of the government workers had Master's degrees compared to 1 percent of the private sector workers.

Table 9.9. Cumulative Percentage of Educational Attainment by Class of Worker and Sex: 2005

Class of Worker	Total	Elementary	High School	High School Graduate	Some College	Associate Degree	Bachelor's Degree	Masters and above
Employed 16 years & over:	9,777	100	88.1	78.1	31.3	20	10.1	2.1
Private wage & salary	5,849	100	92.9	78	21.1	12.9	6.8	0.9

Private wage & salary	2,164	100	94.1	80	23.7	14	6.7	0.6
Government	1,379	100	96.2	89.8	61.4	41.6	20	4.6
Other	252	100	66.7	47.6	24.2	14.7	10.3	2

Source: OPS, 2005 Census, Table 109

As noted earlier, while females made up a much smaller proportion of the labor force than males, they were better educated. About 20 percent of the female government workers had Bachelor's degrees compared to 13 percent of the males, and 90 percent of the female government workers had high school diplomas compared to 77 percent of the male government employees. In the private sector, the males and females were equally educated – about 7 percent of each had Bachelor's degrees.

*Educational attainment and income.* A direct relationship existed in 2005 between personal income and educational attainment. Higher incomes tended to be earned by individuals with higher levels of educational attainment (Table 9.10). The proportion of high school graduates in almost every income category increased from \$1,000 through \$24,999, but the percentage for those with \$30,000 or more was slightly less than the preceding one.

Table 9.10. Educational Attainment by Income in 2004, 25 years &amp; over: 2005

Income	Total	High School Graduate (%)	College Graduate (%)	Male	High School Graduate (%)	College Graduate (%)	Female	High School Graduate (%)	College Graduate (%)
Total, 25 yrs & over	11,816	70.9	18.5	6,597	72.4	29.9	5,219	68.9	4.1
Less than \$1 to \$999	834	52.9	6.7	371	60.9	8.1	463	46.4	5.6
\$1,000 to \$2,499	1,348	60.6	4.7	526	68.6	6.8	822	55.5	3.3
\$2,500 to \$4,999	1,070	52.1	6.2	597	53.3	6.0	473	50.7	6.3
\$5,000 to \$7,499	1,117	64.3	7.6	681	63.6	7.2	436	65.4	8.3
\$7,500 to \$9,999	1,062	74.4	9.7	761	77.8	8.9	301	65.8	11.6

\$15,000 to \$19,999	1,409	75.8	18.3	840	75.4	16.4	569	76.4	21.1
\$20,000 to \$29,999	2,194	88.3	38.7	1,088	88.1	36.9	1,106	88.5	40.5
\$30,000 to \$49,999	391	90.8	60.4	189	93.7	59.3	202	88.1	61.4
\$50,000 or more	294	92.2	70.1	217	93.5	71.4	77	88.3	66.2

Source: OPS, 2005 Census, Table 141

categories contained proportionally more females with high school educations than males with similar schooling.

The correlation between education and income in 2004 generally held for college graduates in Palau as well. For the total working population (and for males) with college degrees, the proportion included increases as the income category increased — including the two highest income categories. The proportion of females increased in each income category except for the highest.

## LANGUAGE

The percentage of Palau's population 5 years and over speaking Palauan at home increased from 65 percent in 2000 to 67 percent in 2005, reversing a recent trend downward, as the rate decreased from 82 percent in 1990 to 65 percent in 2000 (Table

Table 9.11. Language Spoken at Home by State, Palau: 2000 and 2005

State	Language Spoken at Home, 2005						Language Spoken at Home, 2000					
	Total	Percent	Palauan	English	Filipino	Other	Total	Percent	Palauan	English	Filipino	Other

9.11 and Figures 9.5 and 9.5a). This trend was partly the result of a larger percentage of the population speaking English – an increase from 3 percent in 1990 to 16 percent in 2005. But, as noted, immigration had even more impact than the fact that English is increasingly becoming the language of government and commerce. People speaking Philippines languages increased 4 percentage points, from 9.4 percent in 1990 to 13.5 percent in 2000, before decreasing to 11 percent in 2005. And, the percentage speaking “other” languages took even a bigger jump – from 5 percent to more than 12 percent in 2000 – before decreasing to 7 percent in 2005 because of return migration.

Figure 9.5. Percent of People Who do not Speak Palauan, Palau and Koror: 2005

Figure 9.5a. Percent of People Who do not Speak Palauan, Palau and Koror: 2005  
Percent Speaking Palauan by State: 2005

Percent Speaking Palau by Hamlet, Koror: 2005

The language characteristics of the Republic of Palau varied geographically in every census (see the 2000 Census monograph for previous census years). Proportionally fewer individuals in Koror State spoke Palauan at home, but proportionally more spoke a language of the Philippines or English. Relatively high percentages of Airai State residents also spoke a Philippines language or English, a consequence of the large immigrant populations in the more urban states. High percentages of the residents living in most rural states in Palau reported speaking Palauan at home. The exceptions to this latter trend were the Southwest Islands, Hatothobei and Sonsorol states, where high percentages of residents spoke some "other" language — presumably the Carolinian languages traditionally spoken on those islands, but also possibly Indonesian languages spoken by migrants from the nearby islands.

*Age.* The language characteristics of Palau residents in 2005 also varied according to age (Table 9.12). Relatively high percentages of persons aged less than 15 years or 60 years and older spoke Palauan — that is, the young persons who had yet to learn other languages and the old persons whose behavior (and linguistic abilities) were more traditional. Higher percentages of individuals in the middle age groups spoke English or some other language, most probably some language from the Philippines. The higher proportions of non-Palauan speakers in the middle age groups probably comprised mostly immigrants, working age persons who came to Palau from other countries primarily for jobs. In fact, in the 30 to 44 age group, only about half of Palau's residents spoke Palauan at home — about 1 in 6 spoke a Philippines language, 1 in 6 spoke English, and 1 in 10 spoke another language.

The age-specific patterns of language spoken at home by males and females resembled those for all residents of Palau. The male population of Palau had relatively more non-Palauan speakers in all age groups than did the total population, many presumably migrants from places that spoke other languages. The female population of Palau had relatively fewer non-Palauan speakers than either the male residents or all residents.

That is, while 63 percent of the males spoke Palauan, mainly because of the selective immigration, more than 70 percent of Palau resident females spoke Palauan. About 12 percent of the male residents spoke a Philippines language compared to 9 percent of the females, and 10 percent of the males spoke "other" languages compared to 4 percent of the females. English, however, was spoken by about 15 percent of the males and 17 percent of the females.

*Frequency of Palauan language speaking.* Data on frequency of language use provides valuable information to planners on Palauan and English use among non-Palauan and non-English speakers. More discussion of English speaking occurs above and in Chapter 16 comparing Palauans inside and outside Palau and in Chapter 17 on comparing Palau with U.S. and its territories. Of the 6,190 persons 5 years and over who did not speak Palauan at home, 4,718 (76 percent — down from 81 percent in 2000) spoke no Palauan at all. Another 431 (7 percent) spoke Palauan more than the other language, 410 (also 7 percent) spoke the two languages equally often, and 631 (10 percent) spoke the other languages more than Palauan (Table 9.13). On Hatothobei no one spoke Palauan. About 3,100 people in Koror spoke no Palauan, as well as 1,100 in Airai.

## Conclusions

The education and language characteristics of Palau in 2005 showed the influences of mobility in the republic — both in the emigration of Palauans and the immigration – and later return – of foreigners, primarily Filipinos. School enrollment changed little in the first part of the period, but increased considerably between 1995 and 2005. Educational attainment, on the other hand, changed considerably, with the residents of Palau better educated in 2000 than ever before, with some decline between 2000 and 2005. Moreover, over time increasing numbers of young persons, and particularly females, have gained access to formal education, yielding growing educational attainment, increasing proportions of individuals with formal education, and declining illiteracy. As one of the first components of Western society systematically introduced by the U.S. administration, the impact of educational change appeared throughout the Republic of Palau. Today many educated Palauans emigrate, often for jobs. Ironically, much of the change in educational attainment has come not from a system of schooling, but rather as persons educated in their home country before moving to Palau.

Despite the influence of other countries for decades — either as colonial powers, administrative authorities, or sources of immigrants — Palau remains largely a Palauan speaking country, but with diminishing numbers and percentages. The minor inroads of other languages in part relate to changes in the education system, but they most certainly reflect the recent immigrants. Language use varied geographically. In places like Koror and Airai states, more Westernized economies and social development make use of English desirable and provide frequent opportunities to do so. Similarly, most of the immigrants, mainly from the Philippines, resided in these two states, providing a greater opportunity to speak those languages. But outside Palau's two "developed" States – Koror and Airai – English and other languages are secondary to Palauan. Language thus provides one measure of the transition from the "traditional" to the "modern" world.

## CHAPTER 10. RELIGION

Because religion is not asked in United States Decennial Censuses, the item appeared only on Palau's 1995, 2000 and 2005 Censuses. Since the Republic of Palau conducted these censuses, this important item could be included.

### Definitions

Data on religion were derived from answers to questionnaire item 4a, which was asked of all persons. This item had an open-ended question and the enumerators recorded the responses. These responses were later coded using a list of more than 10 identified religions. Persons who said they had no religion were classified into the *None* category, while those who refused to answer the question were classified into the *refused* category.

### Comparability

The question on religion was asked for the first time in a Palau National Census in the 1995 census, and data were shown for all persons regardless of age.

Source: OPS, 2005 Census, Table 10.

Since the 1995, 2000 and 2005 Censuses showed approximately the same distributions for religions, only the 2005 Census results are shown here. Table 10.1 shows the distributions of religions in the 2005 census. About half of the population stating a religion responded that they were Roman Catholic. The next largest group of religion was the Protestants. The named groups included the Evangelicals, Seventh Day Adventist (SDA), and "other" protestant. The data were collected as social indicators and not as part of a census of religions. About 1 in every 6 people in the census responded that they had no religion, or refused to answer the question. As noted above, these data were only edited for "illegal" responses, but were not imputed. Figures 10.1 and 10.1a below show the percent distribution by states of Palau and by hamlets of Koror for the major religious organization in Palau.

Figure 10.1. Percent of People Whose Religion is Catholic, Palau and Koror: 2005

Figure 10.1a. Percent of People Whose Religion is Catholic, Palau and Koror: 2005  
 Percent Catholic by State: 2005

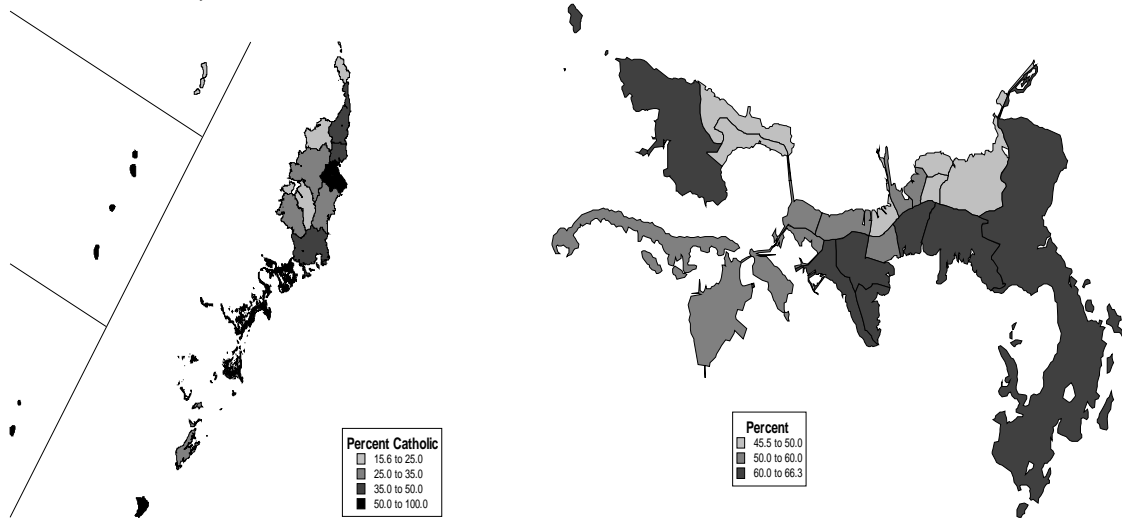

Table 10.2 shows the distribution of religions by State for males. Of the 10,699 males, the largest group were Catholic, with 4,234 or 49 percent of the total. The States showed large variations in numbers for the various religions. The Evangelicals, a Protestant denomination, had 2,291 members, or about 21 percent of the males, Other Religion at about 11 percent, and the rest of the religious groups comprised the remainder of the male religion by state.

Catholics, although the numbers were relatively small.

Males were more likely to have an "other religion" than females, these are probably migrant workers.

Table 10.3 shows similar distributions for females. Again, the largest group was Catholic, followed by Evangelicals, and others. Hatothobei was completely Catholic, while Peleliu, Ngiwal, Ngerchelong, Ngchesar, Ngatpang, Ngaremlengui, and Ngardmau had larger numbers of Evangelicals than

Table 10.4 shows the distribution of religions within each State. More than half of Kayangel was Modekngei, while somewhat less than half of Ngatpang fell in this category. All of Hatohobei's population was Catholic, as were most of those on Sonsorol, and about 4 of every 5 on Angaur.

Table 10.5 shows the distribution of the religions across the States. As with the other variables, because Koror is so large, it influences the distribution for all religions. However, a much smaller percentage of the people practicing the traditional religion – Modekngei – lived in Koror than did practitioners of the other religions. About 12 percent of all Modekngei lived in Ngatpang. About 3 of every 4 Catholics lived in Koror, as did slightly smaller percentages of persons practicing “other” religions and “none or refused.”

## CONCLUSIONS

These tables give a brief look at the distribution of religions on the basis of the 2005 Census. A more thorough analysis could look at the age and sex, and other characteristics of the population by religion. Most Palauans practice a religion, with the majority being either Catholic or Protestant, but with a large number of people still practicing the traditional religion.

## CHAPTER 11. LABOR FORCE PARTICIPATION

As Palau continues to develop economically, census-defined labor force participation data provide measures of government and private sector success in providing jobs. The government of Palau can acquire some data on labor force participation from periodic surveys and registration. Data for the whole population can only be obtained from periodic censuses. However, the value of censuses as systematic sources of data is tempered by time between enumerations — a particular problem for economic data, which can fluctuate rapidly over relatively short periods. The implementation of the Compact of Free Association makes dealing with economic fluctuations even more important.

Here we examine the labor force participation data from the 2005 census, and occasionally compare them to earlier data. We focus on basic topics — age, sex, birthplace, language, and educational attainment for labor force status in the week before the census, and age and sex for work in 2004 (the year before the census), and transportation to work. The goal in examining these topics is to emphasize some of the most important, fundamental aspects of labor force participation in Palau, to provide insights on the Palauan economy.

### Definitions

#### *EMPLOYMENT STATUS*

The 2005 census obtained data on employment status from answers to questionnaire items 21, 25, and 26, asked of persons 15 years and over. The series of questions on employment status was designed to identify several types of individuals in Palau: persons who worked at a job or business or farm at any time during the reference week; persons who did not do this work during the reference week, but who had jobs or businesses from which they were temporarily absent (excluding layoff); persons on layoff; and persons who did not work during the reference week, but who were looking for work to earn money during the previous four weeks and were available for work during the reference week. The employment status data shown in Volume I of the 2005 census report are for persons 16 years old and over.

*Employed.* Employed persons included all civilians 16 years old and over who were either "At work" (those who did any work at all during the reference week as paid employees or in their own business or profession, or on their own farm, or who worked 15 or more hours as unpaid workers on a family farm or in a family business) or were "With a job but not at work" (those who did not work during the reference week, but who had jobs or businesses from which they were temporarily absent due to illness, bad weather, industrial dispute, vacation, or other personal reasons). Excluded from the employed category were: persons without jobs or businesses whose only activity consisted of work around the house or unpaid volunteer work for religious, charitable, and similar organizations; persons without jobs or businesses who did subsistence activity only during the reference week; and persons on active duty in the U.S. Armed Forces.

*Unemployed.* The category of unemployed persons included all civilians 16 years old and over who: were neither "At work" nor "With a job but not at work" during the reference week, or who did subsistence activity only; were looking for work to earn money during the previous four weeks; and were available to accept a job. Examples of job seeking activities include:

- > Registering at a public or private employment office
- > Meeting with prospective employers
- > Investigating possibilities for starting a professional practice or opening a business
- > Placing or answering advertisements
- > Writing letters of application
- > Being on a union or professional register

Also included in the unemployed category were civilians 16 years old and over who did not work at a job or business during the reference week and were waiting to be called back to a job from which they had been laid off.

*Experienced Unemployed.* Experienced unemployed persons were unemployed individuals who worked at any time in the past.

---

*Civilian Labor Force.* The civilian labor force consisted of persons classified as employed or unemployed in accordance with the criteria described above.

*Experienced Civilian Labor Force.* The experienced civilian labor force consisted of the employed and the experienced unemployed.

*Labor Force.* The labor force included all persons classified in the civilian labor force plus members of the Armed Forces (persons on active duty with the U.S. Army, Air Force, Navy, Marine Corps, or Coast Guard).

*Not in Labor Force.* The individuals not in the labor force consisted of all persons 16 years old and over who were not classified as members of the labor force. This category consisted mainly of persons engaged in subsistence activity only, students, housewives, retired workers, seasonal workers enumerated in an off season who were not looking for work, institutionalized persons, and persons doing only incidental unpaid family work (less than 15 hours during the reference week).

*Subsistence Activity.* A person engaged in subsistence activities if he or she mainly produced goods for his or her own or family's use and needs, like growing or gathering food, fishing, cutting copra for home use, raising livestock, making handicrafts for home use, and other productive activities not primarily conducted for commercial purposes. When subsistence activity categories are shown with the "Employed" and the "Not in labor force" categories of the employment status concept, they relate to activities engaged in during the census reference week. Persons who did subsistence activity only during the reference week were not classified as "Employed," unless they were "With a job but not at work" (see definition of "Employed").

*Worker.* This term appears in connection with several subjects—for example, commuting categories, class of worker, weeks worked in 2004, and workers in family in 2004. Its meaning varies and, therefore, should be determined in each case by referring to the definition of the subject in which it appears.

*Actual Hours Worked Last Week.* All persons who reported working at a job or business or farm during the reference week were asked to report in questionnaire item 21b the number of hours that they worked, excluding any time doing a subsistence activity. The statistics on hours worked for "Employed, at work" persons pertain to the number of hours actually worked at all jobs, and do not necessarily reflect the number of hours typically or usually worked or the scheduled number of hours. The concept of "Actual hours" differs from that of "Usual hours worked," described below. The number of persons who worked only a small number of hours probably is understated since these persons sometimes consider themselves as not working. Respondents were asked to include overtime or extra hours worked, but to exclude lunch hours, sick leave, and vacation leave.

*Limitations.* The census may understate the number of employed persons because persons who had irregular, casual, or unstructured jobs sometimes reported themselves as not working. The number of employed persons "At work" probably is overstated in the census (and conversely, the number of employed "With a job but not at work" is understated) since some persons on vacation or sick leave erroneously report themselves as working. This problem has no effect on the total number of employed persons. The reference week for the employment data was not the same for all persons. This lack of a uniform reference week may mean that the employment data do not reflect the employment at any given week. For additional, related information, see the discussion below under *Reference Week*.

*Comparability.* The questionnaire items and employment status concepts for the 1990, 1995, 2000 and 2005 censuses were essentially the same as those used in the 1980 census. However, these concepts differed in many respects from those in earlier censuses.

Since employment data from the census are obtained from respondents in households, they differ from statistics based on reports from individual business establishments, farm enterprises, and certain government programs. Persons employed at more than one job are counted only once in the census and are classified according to the job at which they worked the greatest number of hours during the reference week. In statistics based on reports from business and farm establishments, persons who work for more than one establishment may be counted more than once. Moreover, other non-census data series may exclude private household workers, unpaid family workers, and self-employed persons, but may include workers less than 16 years old.

An additional difference in the data arises because persons who had a job but were not at work are included with the employed in the statistics shown in Volume I of the 2005 census report, whereas many of these persons are likely to be excluded from employment figures based on establishment payroll reports. Furthermore, the employment status data in the 2005 census report included persons on the basis of place of residence regardless of where they worked, whereas establishment data report persons at their place of work regardless of where they live. Census data on hours worked during the reference week may differ from data from other sources. The census measures hours actually worked, whereas some surveys measure hours paid for by employers.

#### *REFERENCE WEEK*

The data on labor force status and commuting characteristics were related to the reference week — that is, the calendar week preceding the date on which the respondents were interviewed by enumerators. This week was not the same for all respondents since the enumeration was not completed in one week. The occurrence of holidays during the enumeration period could affect the data on actual hours worked during the reference week, but probably had no effect on overall measurement of employment status.

Limitations. There are no systematic limitations associated with the collection of labor force data during a reference week.

Comparability. Enumeration began in September for Palau's 1980 and 1995 censuses, so the reference week was also in September. Enumeration began on April 1 for the 1990 and 2000, so the reference week started then. Enumeration in the 2005 census started in March, but used the April 1 reference date; enumerators rechecked their housing units.

#### *WORK STATUS IN 2004*

The 2005 census obtained data on work status in 2004 from answers to questionnaire item 29.

*Work Status in 2004.* Persons 16 years old and over who worked one or more weeks according to the criteria described below were classified as "Worked in 2004"; all other persons 16 years old and over were classified as "Did not work in 2004." Some tabulations showing work status in 2004 include 15 years olds. These persons were classified as "Did not work in 2004" by definition.

*Weeks Worked in 2004.* The census obtained data on weeks worked in 2004 from answers to questionnaire item 29b. Question 29b – Weeks worked in 2004 – was asked of persons who reported in Question 29a that they worked in 2004. The data on this topic pertain to the number of weeks during 2004 in which a person did any work for pay or profit (including paid vacation and paid sick leave, but excluding subsistence activity) or worked without pay on a family farm or in a family business. Weeks of active service in the Armed Forces also were included.

*Usual Hours Worked per Week Worked in 2004.* The 2005 census obtained data on usual hours worked per week worked in 2004 from responses to questionnaire item 29c, a question asked of persons 16 years and over who reported that they worked in 2004. The respondent was to report the number of hours worked per week in the majority of the weeks he or she worked in 2004. If the hours worked per week varied considerably during 2004, the respondent was to report an approximate average of the hours worked per week. The statistics on usual hours worked per week worked in 2004 are not necessarily related to the data on actual hours worked during the census reference week (question 21b). Persons 16 years old and over who reported that they usually worked 35 or more hours each week during the weeks they worked were classified as "Usually worked full time". Persons who reported that they usually worked 1 to 34 hours are classified as "Usually worked part time."

*Year-Round Full-Time Workers.* The category of "Year-round full time workers" included all persons 16 years old and over who usually worked 35 hours or more per week for 50 to 52 weeks in 2004.

*Number of Workers in Family in 2004.* The number of workers per family was the number of individuals in each family who met the requirements of "Worker," as described above under "Work Status in 2004."

Limitations. The number of persons who worked in 2004 and the number of weeks worked may have been understated since some respondents forget intermittent or short periods of employment or exclude weeks worked without pay. Also,

some persons may not include weeks of paid vacation among their weeks worked. One result is that the census figures possibly understate the number of persons who worked "50 to 52 weeks."

**Comparability.** The data on weeks worked collected in the 1990, 1995, 2000 and 2005 censuses are comparable with data from the 1980 and 1970 censuses. Since the 1970 census in Palau, two separate questions have been used to obtain this information. The first identified persons with any work experience during the year and, thus, reported those persons for whom the questions on number of weeks worked applied. In 1970, persons responded to the question on weeks worked by selecting one of six weeks-worked intervals. In 1980 and in later censuses were asked to provide the specific number of weeks they worked.

### Analysis of Labor Force Participation Data

About 69.1 percent of the population 16 years and over in Palau in 2005 was in the labor force, compared to 67.5 percent in 2000 (Table 11.1 and Figure 11.1 to 11.3). The 10,203 individuals in the labor force were either employed or unemployed—remembering that a person had to fulfill the definition of "unemployed" to be unemployed. Persons who were only doing subsistence were considered "not in the labor force". Employed individuals composed 96 percent of the labor force, yielding an unemployment rate of 4.2 percent (almost double that of 2000, but these are relatively small numbers, and subject both to reporting conditions and current economic conditions). The large number of immigrants, almost all of whom worked, caused the very low unemployment rate. Because of the role of subsistence in Palau, the unemployment rate for the Republic probably is something of a combination between a Western-style unemployment rate and self-reported unemployment based on other criteria.

Figure 11.2. Percent in the Labor Force, Palau and Koror: 2005

Figure 11.3. Percent in the Labor Force by State: 2005  
*Percent in the Labor Force by State: 2005*

Although the unemployment rate for all of Palau in 2005 was 4.2 percent, some states — like Aimeliik, Angaur, Hatohobei, Ngardmau, and Ngchesar — had no reported unemployment according to the census. Because places like Hatohobei have few paying jobs, an absence of unemployment tends to obscure what really is occurring. Also, Kayangel and Sonsorol each reported only 2 persons unemployed, probably not required programs for unemployment alleviation.

In general, labor force participation rates also varied considerably between states. About 69 percent of Koror State's adult population participated in the labor force, as did nearly 77 percent of Airai's adult population. Most of the other states, being more rural, had much smaller labor force participation percentages. See Figure 11.4 below.

Figure 11.4. Percent Unemployed by State: Palau and Percent in Labor Force, Koror: 2005  
*Percent Unemployed by State: 2005*

*Percent in Labor Force by Hamlet, Koror: 2005*

Male labor force participation in Palau was greater than total labor force participation in 2005 (Table 11.2 and Figure 11.5). About 77 percent of the males aged 16 years and over were in the labor force, with an unemployment rate of 4 percent. Koror State, with more than 74 percent of its adult males in the labor force, and Airai State at 85 percent, provided among the highest labor force participation rates. Although several other states had relatively high percentages of male labor force participation, much of this participation represents state government workers. The private sector, except for small retail stores and fishing enterprises, is little developed outside Koror and Airai.

Figure 11.5. Percent of Males in the Labor Force for Palau and Koror: 2005

Percent of Males in the Labor Force by State: 2005

Percent of Males in Labor Force by Hamlet, Koror: 2005

In contrast to male employment figures, only about 60 percent (6 out of every 10) of the adult females in Palau were employed in 2005 (Table 11.3 and Figure 11.6). Almost 63 percent the females in Koror were in the labor force, compared to 60 percent in Airai. The unemployment rate for females in Palau was slightly higher than either the total or male unemployment rates in 2005. Once again, the excessively high unemployment rates for certain states probably are overstated if one strictly follows U.S. definitions. (See also Figures 11.7)

Figure 11.6. Percent Females in Labor Force by State: 2005

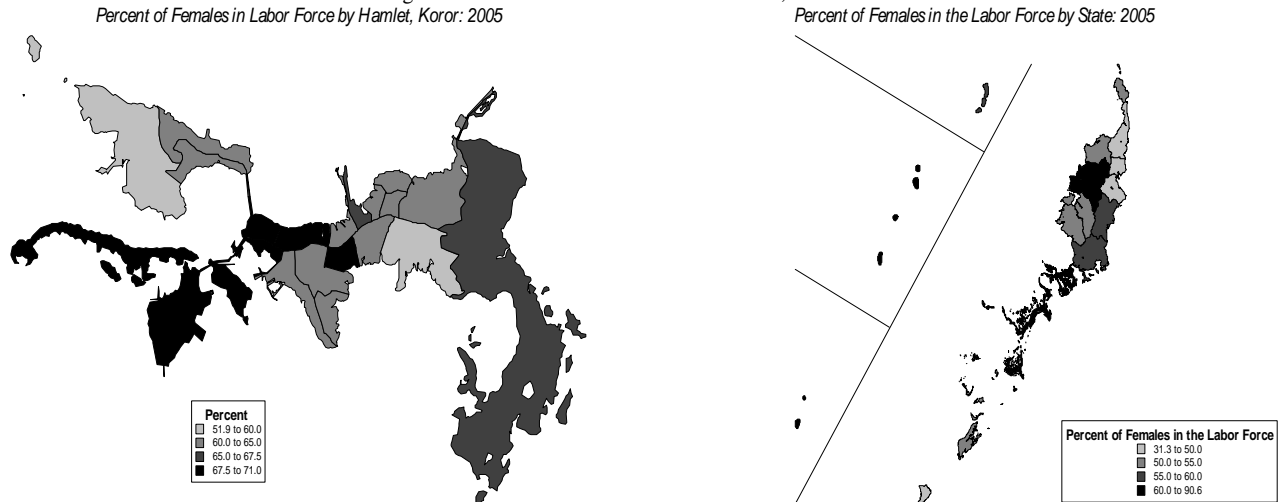

Figure 11.7. Percent Females in Labor Force, Koror: 2005

Labor force participation in Palau varied considerably by age (Table 11.4 and Figure 11.8). Although about 2 out of every 3 adults were in the labor force in 2005, less than 1 in 10 individuals aged 16 to 19 years, but almost 2 of 10 of those 65 years and older were included—many of the young persons having yet to begin working and many of the older persons having already retired. The rate for persons 65 years and over was double the rate for 2000, indicating that older people are staying in the labor force longer (see the 2000 Census Monograph). In contrast, more than 4 of every 5 residents in Palau aged 25 to 54 years were in the labor force.

Table 11.4. Labor Force Status for Persons 16 yrs. &amp; Over by Age Group: 2005

Age Group	Total	In Labor Force		Employed		Unemployed	
		Number	Percent	Number	Percent	Number	Percent
Total 16 + yrs	14,755	10,203	69.1	9,777	95.8	426	4.2
16 to 19 years	1,108	105	9.5	76	72.4	29	27.6

Source: OPS, 2005 Census, Table 68

Figure 11.8. Percent in Labor Force and Unemployment by Age: 2005

Unemployment rates tended to decrease as age increased. Persons aged 16 to 19 years were the most likely to be unemployed, either because they were just entering the labor force, could not find work or because they had trouble keeping their jobs. About 3 in every 10 teenagers in the labor force were looking for a job but hadn't yet found one (or had lost one and not found another one). About 1 in every 10 of the adults 20 to 24 were unemployed, but the percentages then decreased until about retirement ages. Once again, due to the nature of Palau's economy it is unclear how many of the unemployed should be classified as "not in the labor force" instead of in the labor force but unemployed — reducing the reliability of these figures.

Male labor force participation also varied with age (Table 11.5 and Figure 11.9), paralleling the general pattern noted above for all residents of Palau. Each male age group had higher percentages in the labor force than for the total population, with the three age groups between 25 and 54 years having labor force participation rates in excess of 80 percent, and 90 percent for those 25 to 44 years old. About 1 in 10 of those aged 16 to 19 years were in the labor force, while almost 1 in 4 of the males aged 65 years or more were similarly classified.

Table 11.5. Labor Force Status for Males 16 yrs. & Over by Age Group: 2005

Age Group	Total	In Labor Force		Employed		Unemployed	
		Number	Percent	Number	Percent	Number	Percent
Males 16 + yrs	8,076	6,214	76.9	5,982	96.3	232	3.7
16 to 19 years	546	64	11.7	49	76.6	15	23.4
20 to 24 years	712	452	63.5	401	88.7	51	11.3
25 to 34 years	2,014	1,810	89.9	1,751	96.7	59	3.3
35 to 44 years	2,228	2,047	91.9	2,002	97.8	45	2.2
45 to 54 years	1,466	1,291	88.1	1,270	98.4	21	1.6
55 to 64 years	647	438	67.7	409	93.4	29	6.6
65 years and over	463	112	24.2	100	89.3	12	10.7

Source: OPS, 2005 Census, Table 68

Unemployment for males in Palau also varied with age, the pattern seen once again paralleling that described for the entire population. The unemployment rates for males tended to be lower than for the whole population, so the rates for females tended to be higher.

Female labor force participation characteristics resembled those documented for all adult residents of Palau and for adult males, although the participation rates were lower for all age groups (Table 11.6 and Figure 11.9). The percentages of females in each age group within the labor force once again peaked near the middle of the age distribution, with more than 3 in 4 females in the two age groups between 25 and 44 years. Participation in the labor force once again was substantially lower for females in the youngest and oldest age groups than for females in the remaining age groups, with only 5 percent of those aged 65 years and older participating. The data presented show a greater likelihood for younger women to participate in the labor force—probably due both to increased education and training as well as to differences in the behavior of younger and older generations.

Table 11.6. Labor Force Status for Females 16 yrs. & Over by Age Group: 2005

Age Group	Total	In Labor Force		Employed		Unemployed	
		Number	Percent	Number	Percent	Number	Percent
Females 16 + yrs	6,679	3,989	59.7	3,795	95.1	194	4.9

Source: OPS, 2005 Census, Table 68

Figure 11.9. Percent in Labor Force by Sex and Ages 16 to 19: 2005, 1990 to 2005

Unemployment rates for adult females in Palau varied according to age similarly to those for all adults and adult males. Overall unemployment for females exceeded that for males, as noted above.

Persons born in Palau were less likely than immigrants to be in the labor force, partially because some Palauans were doing subsistence and other traditional activities and partially because many immigrants came specifically to work (Table 11.7 and Figure 11.10). About 86 percent of those born outside Palau (and also outside the U.S.) were in the labor force, including 95 percent of those born in the Philippines and 90 percent of those born in China. These figures show decreases from labor force participation rates for Asians in the 2000 Census, and while the numbers are small, could indicate that some are no longer in the private sector, and may be looking for work. The figure for the Federated States of Micronesia (FSM) was much lower because most were students at the Palau Community College. Although about 58 percent of the residents of U.S.-born in Palau were in the labor force, this figure probably includes wives and children of contract and other workers.

Table 11.7. Labor Force Status by Birthplace: 2005

Birthplace	Total	In Labor Force		Employed		Unemployed	
		Number	Percent	Number	Percent	Number	Percent
Total 16 + yrs	14,755	10,203	69.1	9,777	95.8	426	4.2

Source: OPS, 2005 Census, Table 81

Figure 11.10. Percent in Labor Force by Birthplace: 1990 to 2005, 2005 only

As noted above, about 6 percent of the Palau-born adults residing in Palau were unemployed in 2005, about 2 percentage points higher than the rate for all workers. In contrast, less than 1 percent of the adult residents of Palau who were born in Asia were unemployed. These low unemployment rates for most non-Palau born are understandable. Foreign workers in Palau must work to serve their purpose for being there. If they do not work, they have to return home. Nearly 18 percent of the FSM born were unemployed, providing additional evidence that many were students. About 9 percent adult resident of U.S. born was unemployed.

**Language Spoken at Home and Frequency of Palauan by Labor Force Participation.** Persons who spoke Palauan at home were less likely to be in the labor force than those who spoke some other language (Table 11.8). Although 59 percent of those who spoke Palauan at home were in the labor force, this was true for fully 86 percent of those who spoke another language. As discussed in Chapter 9, very few people in Palau spoke other Languages at home and most of them were not Paluans. The majority of adult residents of Palau in 2005 spoke Palauan rather than English or another language at home, as would be expected. As the frequency of Palauan usage decreased, labor force participation increased. More than 60 percent of those who spoke Palauan and another language equally often at home were in the labor force. About 70 percent who spoke Palauan at home more often than another language were in the labor force, up from only 53 percent in the 2000 census. Similarly, 90 percent of the individuals who did not speak Palauan at home at all were in the labor force.

Table 11.8. Labor Force Status by Language and Ability: 2005

Language and Ability	Total	In Labor Force		Unemployed	
		Number	Percent	Number	Percent
Total 16 + yrs:	14,755	10,203	69.1	4,552	30.9
Speak Only Palauan	9,202	5,432	59.0	3,770	41.0
Speak Other Language	5,553	4,771	85.9	782	14.1
More than Palauan	482	340	70.5	142	29.5
Both Equally often	294	177	60.2	117	40.0

Doesn't speak Palau	4,465	4,039	90.5	426	9.5

Source: OPS, 2005 Census, Table 114.

Unemployment also varied with language spoken at home, but the numbers are so small that it is difficult to make any definitive statements. About 7 percent of those speaking Palauan only were unemployed compared to less than 1 percent of the non-Palauan speakers.

**Educational Attainment and Labor Force Participation.** A close relationship also existed between educational attainment and employment (Table 11.9 and Figure 11.11). The likelihood of participating in the labor force depends on the level of education obtained. Although figures fluctuated for the lowest levels of education, starting with two years of high school a direct correlation emerged between level of schooling and labor force participation. For example, about 82 percent of the high school graduates in Palau were in the labor force (down from 85 percent in 2000), increasing to 84 percent of those with bachelor's degrees and about 86 percent with higher degrees (compared to 92 percent in 2000).

Source: OPS, 2005 Census, Table 115

Figure 11.11. Percent in Labor Force and Unemployment by Education: 2005

Unemployment, in contrast, tended to decrease as level of educational attainment increased. Once again, persons with lower levels of education experienced considerable fluctuation in unemployment. However, beginning with persons having three or more years of high school, unemployment rates decreased as level of education increased.

## WORK IN 2004

Until now, this chapter has examined labor force characteristics during the week preceding the 2005 census. The 2005 census of Palau also collected information about work during all of 2004. Whereas the data on work in the week before the census provides current labor force participation, the data on work the year before the census provide longer-term work patterns.

The total working population in Palau continues to increase because of economic development, and that economic development bringing in many foreign workers (Table 11.10 and Figure 11.12). The absolute count of workers

increased from 7,470 in 1994 to 8,748 in 1999 and 9,562 in 2004. The percentage of persons who worked 50 to 52 weeks increased from 78.9 percent in 1994 (for the 1995 census) to 81.6 percent in 1999 and 85.6 percent in 2004. The percentage working 40 to 49 weeks decreased throughout the period, while those working only 1 to 26 weeks decreased between 1999 and 2004.

Sources: OPS, 1995, 2000 and 2005 Censuses, Table 19

The percentage of full-time workers—those working 35 hours or more per week—increased during the period. Thus, even those persons who started working sometime during the year (probably having migrating) tended to work full-time once employed in Palau. The percentage of full-time workers who worked 50 to 52 weeks also increased throughout the period. Part-time workers decreased over time.

The number of males in the labor force in the year before the census increased by almost 19 percent during the 5-year period between 1994 and 1999, and another 9 percent between 1999 and 2004 (Table 11.11). The percentage of full time workers remained at just over 80 percent – about 4 in every 5 male adults – in the earlier censuses, but jumped to 87 percent in 2004. The percentage of males who were working full-time also increased over time. Very few males worked only part-time for pay during the year before the census. In general the full time workers increased no matter how many weeks worked, and the percentage doing part-time work decreased.

The number of females working in Palau in the year before the census increased by 15 percent between 1994 and 1999 and another 9 percent between 1999 and 2004 (Table 11.12). The percentage of females working the whole year – 50 to 52 weeks – increased by 26 percent between 1994 and 1999 and another 10 percent in the next 5 years. About 76 percent of the female workers in 1994 worked the whole year, compared to 84 percent of those in 1999 and 2004. Also, the full-time full-year female workers increased

Source: OPS, 2005 Census, Table 81

About 65 percent of the workers in Palau aged 16 years and over worked in 2004, but, of those, 93 percent were working full-time (Table 11.13 and Figure 11.13). Proportionally fewer of those born in Palau worked full-time in 2004 (but more than half) than those born in Asia (99 percent). In contrast, 9 percent of Palau-born workers in Palau worked part-time in 2004, compared to less than 1 percent of the Asia-born workers.

Figure 11.13. Percent working 35 hours or more, 40 weeks or more in 2004: Palau and Koror 2005

Although about 90 percent of the workers in Palau worked 50 to 52 weeks in 2004, the number of weeks worked varied with age (Table 11.14). For example, about 32 percent of the 16 to 19 year olds worked the entire year (compared to 72 percent in 1999 based on the 2000 census – they may have stayed in school), compared to about 88 percent of workers aged 35 to 44 years. About half of workers in the youngest age group worked 13 weeks or less in 2004, with decreasing percentages by age until those of retirement age.

Source: OPS, 2005 Census, Table 81

Palau-born persons were more likely to have worked all of 2004 than resident workers born in Asia or elsewhere (Table 11.15). Although nearly 86 percent of all workers in Palau worked 50 to 52 weeks, this was true for almost 90 percent of those born in Palau. In contrast, only 3 percent of the Palau-born workers fell within the “one to 13 week” category in 2004, compared to 5 percent of the workers born in Asia and 11 percent of those born elsewhere. In general, all workers showed a tendency to work the entire year of 2004.

About 87 percent (up from 82 percent in 2000) of the full-time workers in Palau worked 50 weeks or more in 2004 (Table 11.16). About 92 percent of the Palau-born full-time workers worked the whole year compared to 81 percent of the Asia born and 79 percent of the “others” born workers. Asians had the highest percentage of workers working 27 to 49 weeks at 3 percent, while Palau and Others registered almost the same percentage, and Others with about 0.4 percent higher than Palau for workers working 27 to 39 weeks.

Source: OPS, 2005 Census, Table 68.

The largest group of workers in 2004 was aged 35 to 54 years, followed by those aged 25 to 34 years (Table 11.17). More than 78 percent of the adult populations in both of these age groups worked in 2004 (compared with 74 percent in the previous census), with over 94 percent of the

workers in each group working full-time.

Of the workers in Palau who worked full-time in 2004, more than 87 percent worked that entire year, which compared to 82 percent in 1999 (Table 11.18). Although the number of weeks varied for full-time workers in 2004 by age, in general, workers in Palau – at all ages – tended to work the whole year. In fact, those few working part-time tended to be young so were probably working their way into the labor force.

Table 11.18. Work Status of Full-time Workers in 2004 by Age: 2005

Work Status in 2004	Total	16-19 years	20-24 years	25-34 years	35-54 years	55-64 years	65 yrs & over
Usually work 35+ hrs/wk:	8,909	75	623	2,591	4,955	544	121
Percent:	100.0	100.0	100.0	100.0	100.0	100.0	100.0
50 to 52 weeks	86.8	33.3	67.9	84.4	90.7	90.4	90.1

Source: OPS, 2005 Census, Table 68.

The proportion of inhabitants aged 16 years and over who worked in 2004 varied substantially among the states of Palau, including 66 percent for Koror and 72 percent for Airai (Table 11.19). Rural states tended to have proportionally fewer adult residents who worked in 2004, the usefulness of the values for many states limited due to the small numbers of persons involved. The majority of workers in all but Kayangel, Melekeok, Ngaraard, Ngardmau, Ngaremlengui, Ngatpang, Ngiwal, Ngerchelong, and Peleliu worked 50 to 52 weeks in 2004; these values were less than reported in 1999, indicating that workers in rural areas are more likely to work less than half the year recently than formerly. About 57 percent of the workers in Koror and 63 percent of the workers in Airai worked all of 2004.

Table 11.19. Work Status in 2004 by State: 2005

Subsistence activities

A subsistence worker is one whose sole economic work is to provide food for his or her own family and to sometimes give subsistence production away to friends or relatives for no payment, but not to sell. Two questions in the 2005 Census collected data on subsistence – (1) whether a person 16 years and over did subsistence activities, whether also working for pay or not, and (2) if they did subsistence, the type or types of subsistence they did. Table 11.20 shows that about 12 percent of all workers in Palau in 2005 did subsistence alone (343 people) or in addition to paid employment (1,404 people), compared with 5 percent in 2000. Reporting was clearly better than in 2000.

Table 11.20. Paid Work and Subsistence Activity by State: 2005

State	Total	Paid work, no subsistence	Doing Subsistence		Paid work & subsistence	Subsistence only	No work
			Total	Percent

Figure 11.14 gives the percentage distribution of people doing some subsistence by state of residence, and also by hamlet of residence in Koror State.

Figure 11.14. Percent Doing Some Subsistence; Palau and Koror: 2005

About 5 percent of Koror's workers were doing subsistence activities, either alone or in combination with paid work. More than half of Ngaraard's workers did subsistence activities, as did almost half of those in Ngchesar.

Table 11.21 shows results of the item on types of subsistence activities asked of all persons claiming to be doing subsistence in the week before the census. The results differ from the previous table because handicrafts are not shown here, and some people reported they did subsistence, but not type of subsistence. Many of the people did more than one type of subsistence activity so they appear in the table more than once. Fishing was the largest category, at 933 (compared to 320 in 2000), followed by gardening with 918 people (compared to 473 in 2000), and animal-raising with 333 (100 in 2000). (See also Figures 11.15 and 11.16)

**Conclusion:** Insights about Palau's economy from census data are inherently limited by the relatively long periods between censuses. To complicate matters, as Palau evolves economically from a more traditional, subsistence-based economy to a more market-based economy, many of the statistics collected by conventional censuses are of limited use. Nevertheless, examining systematically collected data on economic topics provides a basic understanding of Palau's economy. In this chapter, we focused on labor force participation and associated issues.

A number of trends emerge from data collected by the 2005 census. More than half the residents of Palau in 2005 were part of the labor force at some time in 2004. With few exceptions, labor force participation was stronger among males than among females. Similarly, the greatest labor force participation in both absolute and relative terms occurred among individuals in middle age groups, those aged 20 to 64 years old. Foreign-born residents of Palau tended to have higher rates of labor force participation than Palau-born persons — in part because most foreigners must work in order to stay in Palau and in part because most foreigners migrate to Palau specifically for jobs. Labor force participation tended to increase with the amount of English spoken at home and with level of educational attainment.

In this chapter we looked at several facets of the Palauan economy. One of the most important, recurring themes is the growing role played by workers from other countries. The tendency for immigrants to work full-time emerged time and again, as did their tendency to work for less than an entire year prior to the most recent census — testimony both to their interest in working and to their impermanence. A second theme concerns the importance of education in the Palau's increasingly Westernized culture coupled with the importance of some facility in speaking English. As Palau's economic foundation continues to evolve, educational attainment and ability to communicate in English will probably continue to grow in economic importance.

## CHAPTER 12. OCCUPATION, INDUSTRY, AND CLASS OF WORKER

Although labor force participation — whether people have jobs is important — the type of work gives a more complete understanding of a country's economy. Now we examine occupation, industry, and class of worker to explore issues related to Palau's workforce.

### Definitions

#### *INDUSTRY, OCCUPATION, AND CLASS OF WORKER*

Industry, occupation, and class of worker data were derived from answers to questionnaire items 26, 27, and 28. Industry is a worker's kind of business or government agency and occupation is the kind of work a person does, class of worker is whether they work in the public or private sector.

For employed persons, data on industry, occupation, and class of worker refer to the respondent's job during the reference week. For individuals who worked at two or more jobs, the data refer to the job at which the person worked the greatest number of hours. For unemployed persons, the data concerning work type refer to their last job. The industry and occupation statistics are based on the detailed classification systems developed for the 1990 census. These

systems were also used in 1995, 2000 and 2005. The *Classified Index of Industries and Occupations* provides additional information on the industry and occupation classification systems.

Respondents provided data for census tabulations by reporting information on their industry and occupation. In 2005, the descriptions obtained were referred to clerical staff in the Office of Planning and Statistics processing office for coding. The clerical staff converted the written questionnaire descriptions to codes by comparing these descriptions to entries in the *Alphabetical Index of Industries and Occupations*.

**Industry:** The industry classification system developed for the 1990, 1995, 2000 and 2005 censuses consisted of 235 categories for employed persons, organized in 13 major industry groups. Since 1940, the industrial classification was based on the *Standard Industrial Classification Manual* (SIC). The 2005 census classification was developed from the 1987 SIC published by the Office of Management and Budget, Executive Office of the President of the United States. Palau uses the U.S. definitions in its economic variables.

The SIC was designed primarily to classify establishments by the type of industrial activity in which they were engaged. However, census data, which were collected from households, differ in detail and nature from those obtained from establishment surveys. As a result of this difference, the census classification systems (although defined in SIC terms) cannot reflect the full detail of all categories. There are several levels of industrial classification found in census products.

**Occupation:** The occupational classification system developed for the 2005 census consisted of 500 specific occupational categories for employed persons arranged into 6 summary and 13 major occupational groups. This classification was developed to be consistent with the *Standard Occupational Classification (SOC) Manual: 1980*, published by the Office of Federal Statistical Policy and Standards, U.S. Department of Commerce. Tabulations with occupation as the primary characteristic present several levels of occupational detail.

Some occupation groups are related closely to certain industries. Operators of transportation equipment, farm operators and workers, and private household workers account for major portions of their respective industries of transportation, agriculture, and private households. However, the industry categories include persons in other occupations. For example, persons employed in agriculture include truck drivers and bookkeepers; persons employed in the transportation industry include mechanics, freight handlers, and payroll clerks; and persons employed in the private household industry include occupations like chauffeur, gardener, and secretary.

**Class of Worker:** The 2005 census obtained data on class of worker from answers to questionnaire item 28. The information on class of worker referred to the same job as a respondent's industry and occupation and categorizes persons according to the type of ownership of the employing organization. The 2005 Palau Census defined class of worker categories as follows:

**Private Wage and Salary Workers:** Included persons who worked for wages, salary, commission, tips, pay-in-kind, or piece rates for a private for profit employer or a private not-for-profit, tax-exempt, or charitable organization. Self-employed persons whose business was incorporated were included with private wage and salary workers because they were paid employees of their own companies. Some tabulations presented data separately for the following subcategories: "For profit," "Not for profit," and "Own business incorporated." Employees of foreign governments, the United Nations, or other formal international organizations were classified as "Private-not-for-profit."

**Government Workers:** Included persons who were employees of any local, State, Palau National, or U.S. Federal governmental unit, regardless of the activity of the particular agency. For some tabulations, the data were presented separately for the various levels of government.

**Self-Employed Workers:** Included persons who worked for profit or fees in their own unincorporated business, profession, or trade, or who operated a farm.

**Unpaid Family Workers:** Included persons who worked 15 hours or more without pay in a business or on a farm operated by a relative.

**Salaried/Self-Employed:** In tabulations that categorized persons as either "Salaried" or "Self-employed," the salaried category included private and government wage and salary workers. "Self-employed" included self-employed persons

and unpaid family workers.

The industry category "Public administration" was limited to regular government functions like legislative, judicial, administrative, and regulatory activities of governments. Other government organizations like schools, hospitals, liquor stores, and bus lines were classified by industry according to the activity in which they were engaged. On the other hand, the class of worker "Government categories" included all government workers.

Occasionally respondents supplied industry, occupation, or class of worker descriptions that were not sufficiently specific for precise classification or did not report on these items at all. Some of these cases were corrected through the field editing process and during coding and tabulation operations. In the coding operation, certain types of incomplete entries were corrected using the *Alphabetical Index of Industries and Occupations*. For example, it was possible in certain situations to assign an industry code based on the occupation reported.

Following the coding operations, a computer edit first determined whether a respondent was in the universe that required an industry and occupation code. The codes for the three items (industry, occupation, and class of worker) were checked to ensure they were valid and were edited for their relation to each other. Invalid and inconsistent codes were either blanked or changed to a consistent code. If one or more of the three codes were blank after the edit, a code was assigned from a similar person based on other items. If all the labor force and income data also were blank, all these economic items were assigned from one other person who provided all the necessary data.

Limitations. There are no obvious limitations of the data on industry, occupation, and class of worker collected in the 1990, 1995, 2000 and 2005 censuses.

Comparability. Comparability of industry and occupation data was affected by a number of factors, primarily the systems used to classify the questionnaire responses. Changes in the 2005 Census for Palau were needed to recognize the birth of new industries and occupations, the death of others, and the growth and decline in existing industries and occupations, as well as the desire of analysts and other users for more detail in the presentation of the data. Probably the greatest cause of incomparability is the movement of a segment of one category to a different category in a subsequent census. Unfortunately, changes in the nature of jobs and respondent terminology, and refinement of category composition, made these movements necessary.

The 1990, 1995, 2000 and 2005 occupational classification systems essentially were the same as that for the 1980 census. However, the conversion of the census classification to the SOC in 1980 meant that the 1990 and later censuses' classification system was less comparable to the classifications used prior to the 1980 census.

Other factors that affected data comparability included the universe to which the data referred, how the industry and occupation questions were worded on the questionnaire, improvements in the coding procedures, and the handling of "Not reported" cases. In 1970, an allocation process was introduced that assigned these cases to major groups. In 1990, 1995 2000 and 2005, as in 1980, the "Not reported" cases were assigned to individual categories. Selected publications contain information on the various factors affecting comparability and are particularly useful for understanding differences in the occupation and industry information from earlier censuses (U.S. Bureau of the Census, 1968, 1972b, 1988). For citations for earlier census years, see the 1980 Census of Population report, PC80-1-C/D, *Detailed Population Characteristics* (1984).

The 1990 census introduced an additional class of worker category for "Private not-for-profit" employers. This category is a subset of the 1980 category "Employee of private employer," so no comparable data exist before 1990. Also, the 1990 census classified employees of foreign governments, the United Nations, etc., as "Private not-for-profit," rather than "Federal Government" as in 1970 and 1980. Although in theory change in comparability took place, in practice the small number of U.S. residents working for foreign governments made this change negligible. The 2005 and later censuses used the same definitions as the 1990 census.

Comparability between the statistics on industry and occupation from the 1990, 1995, 2000 and 2005 censuses and statistics from other sources was affected by many of the factors described in the section on "Employment status." These factors primarily were geographic differences between residence and place of work, different dates of reference, and differences in counts because of dual job holding. Industry data from population censuses covered all industries and all kinds of workers, whereas, data from establishments often excluded private household workers, government workers,

The distribution of jobs in Palau by industry also changed considerably during 25 years covered by these censuses. As the private sector has developed, more and more people are moving into it, although the number of people working in the public sector also increased during the period. The percentage of those working in professional and related services decreased from 30 to 15 percent, with the percentage in education decreasing from 21 percent to only 9 percent (although the actual numbers of education workers increased from 575 to 851.)

The percentage in construction also decreased from 17 percent to 14 percent, while the actual numbers tripled, from 476 in 1980 to 1,365 in 2005. An apparent coding problem for wholesale made those data unusable for this analysis. Later publications will look at this problem. The numbers and percentages in agriculture and fishing industries increased throughout the period, from 81 (3 percent of the 1980 workers) to 795 (8 percent of all workers in 2005). Other large categories in 2005 included retail trade at 20 percent, although some of these are certainly people working in wholesale, not retail trade. Also, personal entertainment and recreation services increased to about 14 percent of industries about 1990 and continued at that level for the next decade and a half.

Table 12.2. Percent Change for Industry in Palau: 1980 to 2005

Industry	Employed Persons 16 years and over					Percent Change			
	2005	2000	1995	1990	1980	2000-05	1995-00	1990-95	1980-90

Sources: U.S. Census Bureau, 1984, Table 23; 1992c, Table 17, 1995, 2000 and 2005 Censuses, Table 21.

Note: \*\*Unknown for 2005 only, people who did not state their industry

The work force grew by 104 percent between 1980 and 1990, then more gradual – but substantial increases in numeric terms – by almost 50 percent during the 1990s, and 4 percent more during the first half of the 2000s, even with attempts to get immigration under control (Table 12.2). Because of the vast changes in the economy in the last few years, the percentage changes between adjacent jump around a lot, even though the absolute changes are not usually very large. In general, the current industry data show a booming economy, as the number of persons employed in Palau grew rapidly.

The total number of employed males 16 years and over also increased substantially between 1980 and 2005, more than tripling during the period (Table 12.3). However, although employed males comprised the majority of the work force growth during the decades, they grew at a slightly slower pace than the total work force. The number of employed males increased in the agriculture, forestry, fisheries, and mining industry by nearly 508 percent between 1980 and 1990 and those in personal entertainment and recreation services by slightly more than 697 percent during the 1980s. In contrast, male employment in manufacturing non-durable goods and education services declined during that decade.

Table 12.3. Industry for Males: 1980 to 2005

Industry	Number					Percent

Note: \*\*Unknown for 2005 only, people who did not state their industry

The percentage of males in professional and related service industries decreased from 22 percent of the work force in 1980 to about 11 percent in 1990, although the number of these male workers remained about the same. Most of the decline was in education, with a loss of roughly 11 percentage points, presumably as more female teachers moved into the classroom at the expense of the males. The percentage of males in public administration also decreased markedly, from 21 percent to 17 percent of the male work force—in part no doubt due to development in the private sector.

As noted above, a substantial increase in the number of males working in agricultural, forestry, fishing, and mining occurred during the 1980s. Because of this growth, this industry's share of the male work force grew from less than 4 percent in 1980 to more than 11 percent in 1990. The percentage of the male work force involved in personal entertainment and recreational services increased from less than 2 percent in 1980 to nearly 8 percent a decade later. These figures show increased importance of the private sector in general, and tourism and other retail activities in particular. Increases continued during the first half of the 2000s.

In relative terms, the growth in the female work force in Palau during the 1980s and the 1990s was even more pronounced than that experienced by the males, the total in 1990 more than double that recorded in 1980, and continued upward to 2005, an increase of more than 200 percent during the 25 years (Table 12.4). Much of this increase occurred among females in personal entertainment and recreational services, which increased by more than 1,000 percent over the decade of the 1980s. Other industries also showed enormous relative growth, though many started with very small numbers.

Females continue to contribute in large numbers in Palau's labor force. In all, females employed in professional and related services in 2005 represented about 23 percent of the female work force, compared to the 44 percent employed by this industry in 1980. On the other hand, the percentage of females employed in personal entertainment and recreational services grew from less than 5 percent of the work force in 1980 to more than 23 percent a decade later, and 19 percent in 2005. Growth in the percentage of females employed in other industries was more modest, except for wholesale trade, which increased a lot.

Note: \*\*Unknown for 2005 only, people who did not state their industry

Table 12.5 shows Palau-born employed people only. The number of Palau-born employed people increased from 3,711 in 1990 to 4,330 in 1995, but barely moved between 1995 and 2000, before jumping to 5,321 in 2005, an increase of 30 percent during the 15 year period. These figures

show large emigration for Palau-born in the early part of the period, but as seen in Table 12.6, these workers were more than replaced by foreigners.

In 1990, the largest industry categories for Palau-born were Public administration (21 percent), education (14 percent), and retail trade (12 percent). By the 2005 census, the largest groups were Public Administration (30 percent) and Professional and related services (23 percent), the latter including education and health services. The numbers and percentages of Palau-born in construction decreased considerably over the 15 years – from 10 percent to 4 percent – and transportation workers (from 8 percent to 5 percent).

The table also shows the percentage of all workers in the category that were Palau-born. That is, in 1990, 66 percent or about 2 of every 3 workers in the Republic were Palau-born. However, this figure decreased to 56 percent in 1995 and then less than 47 percent in 2000, before bouncing back to 54 percent, showing the success of the program to reduce the proportion of foreign-born workers in Palau. Of course, more than 90 percent of workers in public administration in 2005 were Palau-born. Other large percentages of Palau-born occurred in communications, education, health, and finance.

Table 12.6 shows similar information for non-Palau born. The number of employed non-Palau born increased from 1,888 in 1990 to 3,429 in 1995 (an increase of 82 percent), and to 4,990 in 2000 (an increase of another 46 percent in the late 1990s), or 164 percent for

the decade! The number then decreased to 4,456 in 2005, a decrease from 2000 of 10 percent. The largest numbers of foreigner workers were in construction (26 percent of the total – about the same as in previous years), retail trade at 24 percent (double the percentage of 1990), and personal entertainment and recreation, at 23 percent, about the same percentage through the 15 years.

Source: U.S. Bureau of the Census, 1992c, Table 69, 1995, 2000 and 2005 Censuses, table 131.

in Palau who were high school graduates exceeded 74 percent in 1990 (Table 12.7). Although not shown here, the figure increased from about 53 percent from the 1980 census. Employed females were more likely to be high school graduates than employed males in both 1980 and 1990, the former increasing their lead in this category to almost 80 percent.

The 1995 census showed a dip in percent of employed high school graduates, but the 2000 census showed a major increase, to 86 percent of workers – and about the same for male and female workers (unlike in 1995 when female workers were 9 percentage points higher). It is possible that the 1995 census shows anomalous data, but this seems unlikely since exactly the same procedures were used in each of the censuses. By 2005, however, the percentage high school graduate in industries decreased again, perhaps showing the departure of more educated foreign workers – or the departure of educated Palauans for jobs elsewhere. The percentage high school graduates decreased from 86 percent in 2000 to 78 percent in 2005, with both males and females decreasing similarly. Some industry categories, like communications, remained the same. Others, like agriculture, construction, manufacturing, and other unskilled and semi-skilled industries, decreased in educational attainment.

As noted in Chapters 9 and 11, educational attainment has come to play an increasingly important role in employment in the Republic of Palau. Indeed, the percentage of employed persons

In 2005, the largest occupational category in Palau was services (2,142) followed by technicians, sales, and administrative support, at 2,087 workers (Table 12.8). The largest industrial category was also services. The table shows a close relationship between the industries and the occupations of the people who inhabit them. Reporting problems occurred in repair services and wholesale trade as noted previously.

Table 12.9 shows the percentage distribution of industries within the various occupations. Once again, the relationship between industry and occupation is shown – 84 percent of those in Farming, fishing, and forestry occupations are in those same industries. However, the table also shows that certain occupations go across industries, and certain industries have a variety of occupations. Similarly more than half of those in service by industry were also in service by occupation.

Industry classified by occupation provides a slightly different picture of employment in Palau (Table 12.10). Once again, the close relationship between the two items is seen. About 70 percent of the workers in finance and insurance are technicians, for example. But, while 40 percent of the workers in service industries are also in service occupations, a variety of other occupations are also represented in the table.

Table 12.10. Industry by Occupation in Horizontal Percentages: 2005

## OCCUPATION

The occupation distribution also changed substantially between 1990 and 2005 (Table 12.11). The percentage of managers and professionals stayed about the same over the decade of the 1990s, declining from 24 to 23 percent, but then continued to decrease to 19 percent in 2005. In fact, while all major occupational categories experienced increases in numbers over the decade, the percentage distribution in 2000 was very similar to the distribution in 1990, before changing somewhat in the 2005, with increased numbers of laborers and smaller percentages of most of the other categories. The largest number of workers was in service occupations, followed by those in technical, sales, and administrative support, operators, and managers and professionals. The distribution across categories was remarkably consistent in 2005 showing a robust economy.

Note: \*\*Unknown for 2005 only, people who did not state their occupation

The number of males employed in each occupational category increased between 1990 and 2005, but as with the total population, the categories were remarkably consistent (Table 12.12). The largest major occupation categories in both 1990 and 2000 were precision production and crafts (although declining from 26 percent to 22 percent during the decade), managers and professionals, operators, fabricators and laborers. By 2005, the largest category was operators, fabricators and laborers, followed by managers, and service workers. Males were more likely to manual work than females, as would be expected. The Babeldaob road and other construction activities were primarily responsible for the large number of laborers in 2005.

Females in Palau employed by occupation were more highly concentrated in certain occupations than the males, but showed consistent trends as well (Table 12.13). The largest categories for females were technical, sales and administrative support (36 percent in 1990 declining to 33 percent in 2000), service (31 percent down to 26 percent over the decade), and managers and professionals (28 to 27 percent). Precision productions and crafts increased during the decade from 2 percent in 1990 to 9 percent in 2000. By 2005, the largest categories for females were technical, sales, and administrative support at 35 percent, services at 30 percent, and managers and professionals, at 22 percent. Very few females were operators, fabricators or laborers.

Compared to all employed persons in Palau, those working as managers and professionals were under-represented in the young age categories — as expected, since it usually takes time to work up to managerial ranks (Table 12.14). Young persons were relatively over-represented in technical, sales, and administrative occupations and among those working in service. Older persons were more heavily represented in the managerial and professional occupations. (See also Figure 12.2)

services peaked with the 35 to 44 year olds. The representation of other occupations in Palau varied substantially among the age groups.

The greatest percentages of employed females aged 16 to 24 years in Palau worked in service and as technical, sales and administrative support workers in 2005 (Table 12.16). The highest percentage of females in the second oldest age group — the last one to have many females — was in the managerial and professional occupation category (about 43 percent). Technical, sales, and administrative support occupations were most common throughout the age groups. The representation of other occupations in Palau varied substantially among the age groups.

As with industry, occupation varied between individuals born in Palau and those born elsewhere. As noted earlier, the percentage of Palau-born employed in the work force decreased from about 2 in every 3 workers to less than half of all workers during the 1990s, but rebounded in 2005 to more than half (Table 12.17). About 29 percent of the Palau-born workers were

Table 12.17. Occupation for Palau-born for Ages 16 Years and Over: 1990 to 2005

Note: \*\*Unknown appear in the total but not in the distribution

managers and professionals in 1990, but this increased to about 33 percent in 2000, before decreasing to about 1 in 4 in 2005, mainly because of the large increase in laborers.

The second largest category in the early years shown – technical, sales, and administrative support people – increased only slightly, from 28 to 30 percent between 1990 and 2000, and while decreasing in 2005, became the largest group among the Palau-born. On the other hand, Palau-born in service occupations decreased from 17 percent of the Palau-born workers to 14 percent in 2000 and 2005.

As a consequence of the various changes seen between 1990 and 2005, the proportions of certain occupations filled by Palau-born individuals changed over the 15 years. The percentage of Palau-born managers decreased about 10 percentage points, for example. Similarly, the decrease was from 87 percent to 69 percent for technical sales, and administrative support workers, and from 57 to 35 percent for service workers. Operators, fabricators and laborers experienced the largest decrease, from 78 percent in 1990 to 50 percent – about half – in 2005. Given the magnitude of the shifts, the numbers of all Palau-born persons employed in various occupations experienced comparatively small changes during the 1990s. The large changes occurred because of the emigration of Palauans, and the immigration of foreigners.

Table 12.18. Occupation for Non-Palau Born for Ages 16 Years and Over: 1990 to 2005

Occupation	Number				Percent

Note: \*\*Unknown appear in the total but not in the distribution

All major occupation categories in Palau had increases in non-Palau born workers between 1990 and 2000 before decreasing in 2005 (Table 12.18). The largest category in 2005 was service workers, with 1,400 workers or 31 percent of all the non-Palau born workers. The percent being operators, fabricators, and laborers increased from 6 percent of the non-Palau workers in 1995 to 22 percent in 2005. Most of these were “common” laborers. Many of the categories remained remarkably consistent in percentage terms over the 15-year period, but the percentages of managers and precision production workers decreased.

Occupation by state in Palau varied considerably in 2005 (Table 12.19). With their numerical advantage, the patterns in Koror and Airai states greatly influenced the patterns for all Palau, with managerial and professional occupations the most frequently found in the former (see Figure 12.3) and technical, sales, and administrative occupations more prevalent in the latter. Figure 12.3a shows the distribution of persons who are operators, fabricators and laborers. Other states showed greater variation in proportional distributions of major occupations, the magnitude of the fluctuations often an artifact of the small numbers of total workers involved.

## CLASS OF WORKER

Changes in the proportions of different classes of workers over time reflect the major changes experienced by Palau's economy (Table 12.20). Although statistics from the 8 census years are not strictly comparable due both to changing definitions and to the unavailability of certain types of data for certain years, major trends nevertheless emerge. In 1967, most workers were doing unpaid family labor — probably the last vestiges of a traditional Micronesian economy in Palau.

A second phase occurred for 1970, 1973, and 1980, when government workers comprised the majority of workers in Palau. The heavy representation of government employees has been a characteristic of many economies in Micronesia over the past several decades. Then, in 1990, we see an increase in the proportion of private wage and salary employees at the expense of government employment that continued until 2000, before declining somewhat because of the departure of some of the foreigners. The percentage being private wage and salary workers increased from 37 percent in 1980 to 69 percent in 2000, before decreasing to 60 percent in 2005. The percentage being government workers decreased from 57 percent in 1980 to 29 percent in 2000, before increasing again in 2005 to 35 percent. An increase in work outside the government, as represented in the surge of private wage and salary workers in the last census, is obviously crucial to the development of a healthy, self-sufficient economy in the Republic of Palau. See Figure 12.4, percent distribution by states of Palau and hamlets of Koror.

Figure 12.4. Percent Government Workers, Palau and Koror: 2005  
Percent Government Workers by State: 2005

Similar changes in class of worker over time documented above for all workers in Palau also occurred for male and female workers, although we examine only private wage and salary versus government workers. The 1967 data by sex were similar to the total, but with females represented in much lower proportions for both private and government occupations than males. Both sexes saw a surge in wage employment in the 1970s, particularly in government jobs — with the proportions of workers from each sex employed in the private and public sector varying between 1970 and 1980. Finally, both male and female workers employed in the private sector exceeded the number employed in government jobs in 1990, and the increases continued throughout the 1990s. By 2000, more than 70 percent of the males and about 2 of every 3 female workers were in the private sector; these numbers decreased to 62 percent of the males and 57 percent of the females in 2005.

The majority of private sector workers in 2005 fell within the ages of 25 to 44 years, as would be expected (Table 12.21). Young workers tended to go into the private sector, getting established, and waiting for government job openings; those openings used to develop over time, but often no longer do. The percentage working for the national government in 2005 increased from 9 percent for the 16 to 24 year olds, to 21 percent for the 25 to 34 year olds, and then up to about 1 in 3 of those 45 to 64 years old.

Males were more likely than females to be working in the private sector, but differences occurred by age (Tables 12.22 and 12.23.) For 16 to 24 year olds, 74 percent of the males were in the private wage and salary sector compared to 82 percent of the females. Both male and female private sectors percentages peaked in the youngest group, and then decreased with age, showing more and

more younger people moving into the private sector.

On the other hand, except for the oldest males, the percentage of workers in the National government increased with age, from 9 percent for males 16 to 24 years, to 30 percent for those 45 to 64 years. For females, the percentages working in the national government increased from 10 percent for the 16 to 24 year olds to 32 percent for those 45 to 64 years old.

Source: 2005 Census, Table 21

Employment among different classes of workers varied among the states in Palau in 2005 (Table 12.24), in part according to the availability of different types of employment. Both Airai and Koror had larger percentages of private sector for-profit workers in 2005 than all of Palau, in part because most of these types of jobs were available in these two most Westernized states. Several of the States on Babeldaob had very healthy private sectors, in contrast to earlier census data. Some of the more rural states, in contrast, had

work forces composed of proportionally large amounts of local and territorial government employees, with these occupational classes in most cases representing the majority of the resident labor forces. Class of worker shows a general trend towards increased private sector employment, although the 2005 data themselves show a slight retreat from the movement upward, as Palau grapples with its need to decrease reliance on foreign workers.

### Conclusions:

Census data on occupation, industry, and class of worker provide valuable insights on the economy of Palau, in some cases adding new perspectives on the republic's economy and in other cases supporting ideas developed elsewhere in this monograph. Most occupations and industries gained workers between 1980 and 2005, primarily as a consequence of the generally rapid growth in the total work force of Palau over the decade, with much of this growth in the early years attributable to immigrants. Particularly rapid growth occurred in personal entertainment and recreation services, primarily due to the rapidly expanding tourism industry. Differences existed between occupational patterns based on sex (employment of males, for instance, increasing more rapidly than that of females in construction) and place of birth (non-Palau born occupation in agriculture, forestry, and fishing growing markedly compared to Palau-born individuals). Increased formal training was evident in most occupations, whether measured by vocational training or by high school education. Finally, Palau shifted from majority public sector employment to majority private sector.

Perhaps the most valuable message concerns the changes in the Palau's economy. Many of these changes are not particularly positive, as the economy fights the transition from a traditional base to a market foundation. Palau's work force grew substantially during the two decades. However, much of this growth was due to the addition of labor from other countries, primarily Asia. Moreover, the economy still does not produce much — rather it provides services, with the greatest growth occurring among the tourism industry. But in contrast to many economies in Micronesia, after 1980 the economy of Palau shifted from a majority of reliance on government employment to employment in the private sector. The latter shift was not dramatic, and government employment remains a major player in the overall economic system.

---

## CHAPTER 13. INCOME AND POVERTY

The finances of individuals and households provide important information for planning and policy making. Two categories of financial data are: *income* (the amount of money from various sources for some fixed period) and *poverty conditions*. Earnings of Palau's residents are a measure of the health of the Republic's economy.

This chapter looks at the distribution of individual and household income and poverty in Palau. In addition to describing income and poverty data, we also explore income levels by sex, education, occupation and other variables, both for the 2005 census and over time. These data provide insights into Palau's economy as it continues its transition from subsistence to wage labor and a market economy.

### Definitions

#### *INCOME IN 2004*

The 2005 census obtained data on income in 2004 from answers to questionnaire items 30 and 30a. The census requested information on money income received in the calendar year 2004 from persons 15 years old and over. Each census considers data for the whole calendar year before the year of the census.

*Total income* is the algebraic sum of the amounts reported separately for wage or salary income; net non-farm self-employment and farm self-employment income; interest, dividend, or net rental or royalty income; Social Security or railroad retirement income; public assistance or welfare income; retirement or disability income; remittance income; and all other income.

The category *Earnings* denotes the algebraic sum of wage or salary income and net income from farm and non-farm self-employment. Earnings represent the amount of income received regularly before deductions for personal income taxes, Social Security, bond purchases, union dues, Medicare deductions, and so on.

The census excluded receipts from the following sources as income: money received from the sale of property (unless the recipient was engaged in the business of selling this kind of property); the value of income in kind from food stamps, public housing subsidies, medical care, employer contributions for persons, etc.; withdrawal of bank deposits; money borrowed; tax refunds; exchange of money between relatives living in the same household; and gifts and lump-sum inheritances, insurance payments, and other types of lump-sum receipts.

#### *Income Type in 2004*

The 2005 census reported eight types of income, as follows:

- *Wage or salary income* — included total money earnings received for work performed as an employee during calendar year 2004. This income type includes wages, salary, Armed Forces pay, commissions, tips, piece-rate payments, and cash bonuses earned before deductions were made for taxes, bonds, pensions, union dues, etc.
- *Self-employment income* — included several types of income. Non-farm self-employment income comprised net money income (gross receipts minus expenses) from one's own business, professional enterprise, or partnership. Gross receipts included the value of all goods sold and services rendered. Expenses included costs of goods purchased, rent, heat, light, power, depreciation charges, wages and salaries paid, business taxes (not personal income taxes), etc. Farm self-employment income included net money income (gross receipts minus operating expenses) from the operation of a farm by a person on his or her own account, as an owner, renter, or sharecropper. Gross receipts included the value of all products sold, government farm programs, money received from the rental of farm equipment to others, and incidental receipts from the sale of wood, sand, gravel, etc. Operating expenses included cost of feed, fertilizer, seed, and other farming supplies, cash wages paid to farm hands, depreciation charges, cash rent, interest on farm mortgages, farm building repairs, farm taxes (not personal income taxes), etc. The census did not include the value of fuel, food, or other farm products used for family living as part of net income.
- *Interest, dividend, or net rental income* — included interest on savings or bonds, dividends from stockholdings

---

or membership in associations, net income from rental of property to others and receipts from boarders or lodgers, net royalties, and periodic payments from an estate or trust fund.

- *Social Security income* — included Social Security pensions and survivors' benefits; permanent disability insurance payments made by the Social Security Administration prior to deductions for medical insurance; and railroad retirement insurance checks from the U.S. Government. This income type did not include Medicare reimbursements.
- *Public assistance income* — included supplementary security income payments made by federal or state welfare agencies to low income persons aged 65 years old or over, blind, or disabled; aid to families with dependent children; and general assistance. This type of income excluded separate payments received for hospital or other medical care (vendor payments).
- *Retirement or disability income* — included retirement pensions and survivor benefits from a former employer, labor union, or federal, state, county, or other governmental agency; disability income from sources like worker's compensation, a particular company or union federal, state, or local government, and the U.S. military; periodic receipts from annuities and insurance; and regular income from IRA and KEOGH plans.
- *Remittance income* — included money received from relatives who were civilians living outside the household or in the military outside the household.
- *All other income* — included unemployment compensation, Veterans' Administration (VA) payments, alimony and child support, contributions received periodically from persons not living in the household, military family allotments, net gambling winnings, and other kinds of periodic income other than earnings.

*Income of Households.* Household income included the income of the householder and all other persons 15 years old and over in the household, whether related to the householder or not. Because many households comprised only one person, average household income usually was less than average family income.

*Income of Families and Persons.* In compiling statistics on family income, the 2005 census summed and treated as a single amount the incomes of all members 15 years old and over in each family. However, for persons 15 years old and over the total amounts of their own incomes were used. Although the income statistics covered the calendar year 2004, the characteristics of persons and the composition of families referred to the time of enumeration (for Palau, April 1, 2005). Thus, the income of the family did not include amounts received by persons who were members of the family during all or part of the calendar year 2004 if these persons no longer resided with the family at the time of enumeration. Family income amounts reported by related persons who did not reside with the family during 2004 but who were members of the family at the time of enumeration were included. However, the composition of most families was the same during 2004 as in April 2005.

*Median Income.* The median divides the income distribution into two equal parts, one having incomes above the median and the other having incomes below the median. For households and families, the median income is based on the distribution of the total number of units, including those with no income. The census computed medians for persons based on persons with income. The census computed median income values for all households, families, and persons on the basis of more detailed income intervals than shown in most published tabulations. Median income calculations employed linear interpolation.

*Mean Income.* Mean income represents the total income of a particular statistical universe divided by the number of units in that universe. Thus, mean household income is total household income divided by the total number of households. For the various types of income the means are based on households having those types of income. *Per capita income* is the mean income computed for every man, woman, and child in a particular group. The Census office derived per capita income by dividing the total income of a particular group by the total population in that group.

Be careful in interpreting mean income values for small subgroups of the population. Because extreme values in a distribution strongly influence the mean, this measure of central tendency is especially susceptible to the effects of misreporting and processing errors. The median is not affected by extreme values and thus serves as a better measure of central tendency than the mean when the population base is small. Its inherent problems notwithstanding, the mean is

---

shown in some data products for most small subgroups because, when weighted according to the number of cases, the means can be added to obtain summary measures for areas and groups other than those shown in census tabulations.

Limitations. Since questionnaire entries for income frequently are based on memory and not on records, many persons forget minor or irregular sources of income, leading them to underreport. Underreporting tends to be more pronounced for income sources that are not derived from earnings, like Social Security, public assistance, interest, dividends, and net rental income.

Errors in reporting income also occur due to the misunderstanding of certain census questions like reporting gross rather than net dollar amounts for the question on net self-employment income, yielding an overstatement of this item. Another common error is the reporting of identical dollar amounts in two of the eight types of income items where a respondent with only one source of income assumed that the second amount should be entered to represent total income.

The Republic of Palau's Office of Planning and Statistics used extensive computer editing procedures to process data from the 2005 census, both to reduce reporting errors and to improve the accuracy of the income data. These procedures corrected various reporting deficiencies and improved the consistency of reported income items associated with work experience and information on occupation and class of worker. For example, if persons reported that they were self-employed on their own farm, not incorporated, but had reported wage and salary earnings only, the latter amount was shifted to net self-employment income. Also, if a respondent reported total income only, OPS personnel generally assigned the amount to one type of income according to responses to the work experience and class-of-worker questions. Another problem involved non-reporting of income data. Where income information was not reported, procedures were devised to impute appropriate values with either no income or positive or negative dollar amounts for the missing entries.

In income tabulations for households and families, the lowest income group (for example, less than \$2,500) includes units classified as having no 2004 income. Many of these persons lived on income in kind, savings, or gifts, were newly created families, or represented families in which the sole breadwinner recently had died or left the household. Many of the households and families who reported no income in fact probably had some money income that was not recorded in the census. In Palau, some of these families did subsistence activities only.

The income data presented in the 2005 census tabulations covered money income only. Thus, for example, the large portion of income to farm families in the form of free housing and goods produced and consumed on the farm rather than in money influenced the income of farm and non-farm residents. Of course, some non-farm residents also received non-money income in the form of business expense accounts, use of business transportation and facilities, or partial compensation by business for medical and educational expenses. Some low-income families may have also received non-money in kind income from public welfare programs. Finally, when comparing income data for 2004 with earlier years it is important to remember that an increase or decrease in money income does not necessarily represent a comparable change in real income unless adjusted for inflation.

Comparability. Although the income data collected in the 1980 and later censuses were similar, variations occurred in the detail of the questions. For example, in comparison to the information presented above for the 1990 and later censuses under income type, the 1980 census required each person to report the following seven types of income: wage or salary income; net non-farm self-employment income; net farm self-employment income; interest, dividend, or net rental or royalty income; Social Security income; public assistance income; and income from all other sources.

In addition, between the 1980 and the subsequent censuses minor differences existed in the processing of income data. In both censuses, Census office personnel designated all persons with missing values in one or more of the detailed types of income items and total income as allocated. Each missing entry was imputed either as a *no* or as a dollar amount. If a respondent reported total income but did not answer one or more type of income fields, census personnel generally assigned total income to one of the income types according to the socioeconomic characteristics of the income recipient, designating this person as unallocated. In 1980 and subsequently, all non-respondents with income not reported (whether householders or other persons) were assigned the reported income of persons with similar characteristics.

In 1980, census personnel coded income amounts less than \$100,000 in tens of dollars, and amounts of \$100,000 or more in thousands of dollars; \$5 was added to each amount coded in tens of dollars and \$500 to each amount coded in thousands of dollars. Entries of \$999,000 or more were treated as \$999,500 and losses of \$9,999 or more were treated as minus \$9,999. In 1990, census personnel keyed income amounts less than \$999,999 in dollars, while treating amounts

of \$999,999 or more as \$999,999 and losses of \$9,999 or more as minus \$9,999 in all of the computer derivations of aggregate income. The 1990, 1995, 2000 and 2005 recorded the actual dollar amounts, so the above method wasn't used.

If a person reported a dollar amount in wage or salary, net non-farm self-employment income, or net farm self-employment income, the 1990 and later censuses considered this person as unallocated only if it imputed no further dollar amounts for any additional missing entries.

#### POVERTY STATUS IN 2004

The 1990, 1995, 2000 and 2005 census obtained data on poverty status from answers to the same questions as the income data, questionnaire items 30 and 31. Poverty statistics presented in all of Palau's census publications employ a definition of poverty devised originally by the Social Security Administration in 1964 and subsequently modified by federal interagency committees in 1969 and 1980. Office of Management and Budget Directive 14 designated this modified definition as the standard to be used by U.S. Federal agencies for statistical purposes, and to apply for Federal grants. At the core of the definition was the 1961 economy food plan, the least costly of four nutritionally adequate food plans designed by the U.S. Department of Agriculture. The 1955 survey of food consumption by the Department of Agriculture determined that families of three or more persons spend approximately one-third of their income on food. Hence, the poverty level for these families was set at three times the cost of the economy food plan. For smaller families and persons living alone, the cost of the economy food plan was multiplied by factors that were slightly higher to compensate for the relatively larger fixed expenses for these smaller households.

The income cutoffs used by the Republic of Palau OPS for 1995, 2000 and 2005 and the Census Bureau for 1990 to determine the poverty status of families and unrelated individuals included a set of 48 thresholds arranged in a two-dimensional matrix consisting of family size (from one person to nine or more persons) cross-classified by presence and number of family members under 18 years old (from no children present to eight or more children present). The OPS further differentiated unrelated individuals and two-person families by age of the householder (under 65 years old and 65 years old and over). The total income of each family or unrelated individual in the sample was tested against the appropriate poverty threshold to determine the poverty status of that family or unrelated individual. If the total income was less than the corresponding cutoff, the census classified that family or unrelated individual as *below the poverty level*. The number of persons below the poverty level was the sum of the number of persons in families with incomes below the poverty level and the number of unrelated individuals with incomes below the poverty level.

The poverty thresholds are revised annually to allow for changes in the cost of living, as reflected in the U.S. Consumer Price Index. The average poverty threshold for a family of four persons was \$19,307 in 2004 (Table 13.1). The Census Bureau applies poverty thresholds on a national basis for the U.S. and does not make adjustments to account for regional, state, or local variations in the cost of living. Obviously, conditions in Palau differ, but we use the U.S. poverty levels for comparison with the U.S. and the other Insular Areas.

Table 13.1. Poverty Thresholds in 2004 by Size of Family and Number of Related Children Under 18 Years: 2005

Size of Family Unit	Weighted average thresholds	Related children under 18 years							
		None	One	Two	Three	Four	Five	Six	Seven
One	9,645								
Under 65 years	9,827	9,827							
65 years and over	9,060	9,060							
Two	12,334								
Under 65 years	12,714	12,649	13,020						
65 years and over	11,430	11,418	12,971						
Three	15,067	14,776	15,205	15,219					
Four	19,307	19,484	19,803	19,157	19,223				
Five	22,831	23,497	23,838	23,108	22,543	22,199

Source: U.S. Census Bureau Current Population Survey ([www.census.gov](http://www.census.gov))

*Persons for Whom Poverty Status is Determined.* Poverty status was determined for all individuals except institutionalized persons, persons in military group quarters and in college dormitories, and unrelated individuals aged less than 15 years. These groups also were excluded from the denominator when calculating poverty rates.

*Specified Poverty Levels.* Since the poverty levels currently in use by the U.S. Federal government do not meet all the needs of data users, the Census office presented some of the data for alternate levels. These specified poverty levels were obtained by multiplying the income cutoffs at the poverty level by the appropriate factor. For example, the average income cutoff at 125 percent of poverty level was \$24,134 ( $19,307 \times 1.25$ ) in 1999 for a family of four persons.

**Weighted Average Thresholds at the Poverty Level.** The average thresholds shown in the first column of Table 13.1 are weighted by the presence and number of children. For example, the weighted average threshold for a given family size is obtained by multiplying the threshold for each presence and number of children category within the given family size by the number of families in that category. These products then are aggregated across the entire range of presence and number of children categories, and the aggregate is divided by the total number of families in the group to yield the weighted average threshold at the poverty level for that family size.

Since the basic thresholds used to determine the poverty status of families and unrelated individuals are applied to all families and unrelated individuals, the weighted average poverty thresholds are derived using all families and unrelated individuals rather than just those classified as below the poverty level. To obtain the weighted poverty thresholds for families and unrelated individuals below alternate poverty levels, the weighted thresholds shown in Table 13.1 may be multiplied directly by the appropriate factor. The weighted average thresholds presented in the table are based on the *March 1999 Current Population Survey*. However, these thresholds would not differ significantly from those based on the 2005 census.

**Income Deficit.** Income deficit represents the difference between the total income of families and unrelated individuals below the poverty level and their respective poverty thresholds. In computing the income deficit, families reporting a net income loss were assigned zero dollars and for these cases the deficit was equal to the poverty threshold.

This measure provided an estimate of the amount required to raise the incomes of all poor families and unrelated individuals to their respective poverty thresholds. The income deficit thus is a measure of the degree of impoverishment of a family or unrelated individual. However, one must use caution when comparing the average deficits of families with different characteristics. Apparent differences in average income deficits may, to some extent, be a function of differences in family size.

**Mean Income Deficit.** This measure represents the amount obtained by dividing the total income deficit of a group below the poverty level by the number of families (or unrelated individuals) in that group.

**Limitations.** The most fundamental limitation in the census data on poverty status for 2004 concerns the lack of adjustment for regional, state, or local variation. This limitation is particularly problematic for a place like Palau, which is a separate country with cultural and income characteristics that differ considerably with those of the U.S. Criteria for poverty status defined for the U.S. thus have limited value for the Republic of Palau.

**Comparability.** The poverty definition used in the 1980, 1990, 1995, 2000 and 2005 censuses was the same.

### Analysis of Income and Poverty Data

The median household income in 2004 for the 4,707 households in Palau was \$15,107 (Table 13.2 and Figures 13.1 and 13.1a). In other words, half the households in Palau in 1999 had incomes above \$15,107 and half below. The mean income for these same households was \$20,422 — higher than the median because some of the households had comparatively high incomes, increasing both the total income and the mean calculated from it.

Figure 13.1. Household Income, Palau and Koror: 2005

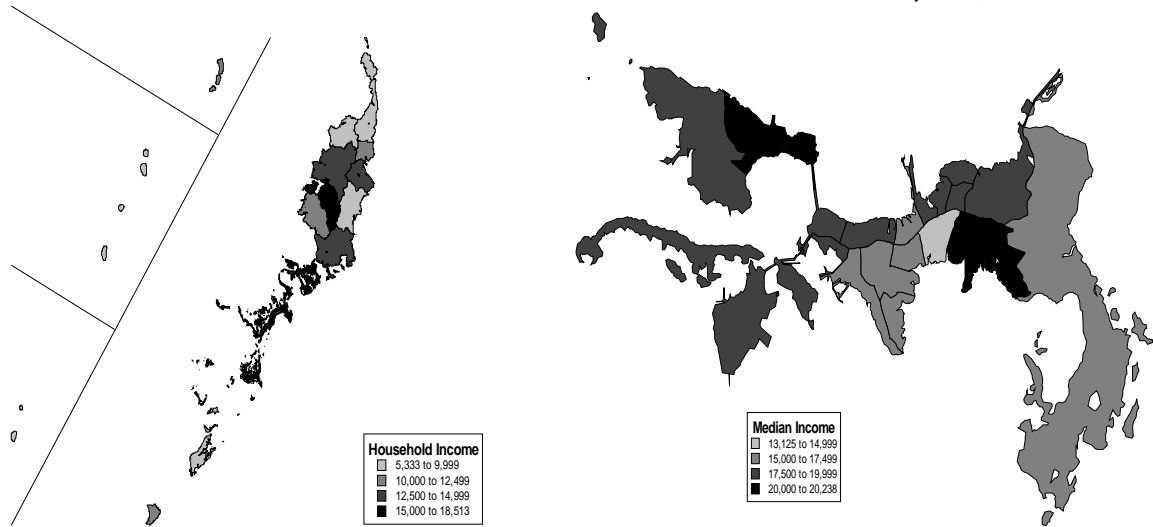

Table 13.2. Household and Family Income in 2004 by State: 2005

State	Households			Families		
	Total	Median Income	Mean Income	Total	Median Income	Mean Income

Figure 13.1a. Median Household Income, Palau and Koror: 2005  
 Median Household Income in 2004 by State: 2005

The median family income in 2004 for the 3,580 families in Palau was nearly \$18,730, somewhat higher than the household median, partly because families required at least two related people living together. As was the case for households, the mean income for families was greater than the median income for families.

Household incomes varied geographically throughout Palau. Koror State had the highest median household income in 2004, at \$18,513. This is not surprising, as Koror State had the best and highest paying jobs. Koror's mean household income was also the highest of the states in Palau, at \$23,902. In contrast, rural states tended to report low 2004 household incomes. Ngchesar at \$5,333 and Hatohebei at \$5,500 both had median incomes below \$6,000, and the medians for Ngarchelong and Ngardmau were between \$6,000 and \$7,000. Better access to better paying jobs in Koror State helps account for the comparatively low-income levels in more rural states. Small numbers of cases affect these data. The small number of households present helps to explain some of the seeming anomalies in the data.

Family incomes similarly varied considerably between states in Palau. Koror State once again had the highest income, with the median family income at \$22,600 and the second highest mean. On the other hand, the median family incomes for Ngchesar and Ngardmau states fell below \$8,000 for 2004. Many family income discrepancies in Palau come from differential access to jobs in the more Westernized, urban Koror and Airai states.

Married couple families had higher median incomes in 1999 than families with female householders with no spouse present (Table 13.3). This discrepancy is not surprising: families headed by females without spouses usually have fewer workers earning money. Moreover, females alone often have more trouble finding both full-time jobs and better jobs. The median income for married couple families in 2004 was nearly \$20,000, about \$4,000 more than the median income for households with female householders with no husband present.

Table 13.3. Median Family Income in 2004 by Type of Family and State: 2005

State	Families			Median Income		
	Total	Married Couple Family	Female, no husband present	Total	Married Couple Family	Female, no husband present

Figures 13.2 and 13.2a shows the median family income by state of Palau, and family income by hamlets of Koror State.

Figure 13.2. Median Family Income and Family Income, Palau and Koror: 2005

Figure 13.2a. Median Family Income and Family Income, Palau and Koror: 2005

Family incomes varied considerably between the states in Palau, both for married couples and for female householders with no husband present. In the states with sufficient families present, Koror once again had families with the highest mean incomes — for total, married couple, and "female householder with no husband" families. Rural-urban differences account for most differences in family income between states, regardless of the type of family. Median family incomes for families having female householders with no husband present were particularly low in many rural states, showing the financial constraints placed upon these families in much of Palau.

## INDIVIDUAL INCOME

Of the more than 15,109 persons aged 15 years and over in Palau in 2005, 14,044 had money income in 2004 (Table 13.4). The median personal income of the average adult in 2004 was \$4,900, with the median for males exceeding the median for females by about \$700. The mean income of persons with income in 2004 was \$7,225; the mean income for males was about \$1,000 more than the mean for females. The medians here were determined using more intervals than in the tables shown in Volume 1, so differ, but are more accurate.

Table 13.4. Income of Persons in 2004 Aged 15 Years and Older by Sex: 2005

Income	Persons with Income			Percent		
	Total	Male	Female	Total	Male	Female
Total:	15,109	8,245	6,864

Mean	7,225	7,652	6,698			

Source: OPS, 2005 Census, Table 134

Note: Medians and means in 2004 dollars.

About 21 percent of persons aged 15 years or more in Palau made \$20,000 or more in 2004, including roughly 20 percent of the males but less than 23 percent of the females. On the other hand, slightly more than 14 percent of the females made less than \$1,000 in 2000 compared to only 14 percent of the males. In fact, females were catching up with males, and unlike in 1999, it was still true in 2004 that more females than males were in the low-income groups, the sexes were more equal in the upper income groups.

Table 13.5 shows the change in income between 1994 and 2004, both in contemporary dollars and in 2004 dollars (adjusting the 1994 and 1999 figures to account for inflation).

Table 13.5. Income in 1994, 1999; 2004 Aged 15 Years & Older by Sex: 1995 to 2005

Income	In Contemporary Dollars			In 2004 Dollars

In real terms, that is, adjusting for inflation, the data show decreases in both median and mean income over time. It is important to remember that the inflation rates are based on the U.S. and don't necessarily reflect what is going on in Palau. The median value decreased from about \$10,000 to less than \$8,000 during the 10 years, and the median value from \$5,600 to \$4,500, less of a decline. Figures 13.3 and 13.3a; per capita income by states of Palau, and by hamlets of Koror State for 2004.

Figure 13.3. Per Capita Income, Palau and Koror: 2004:2005

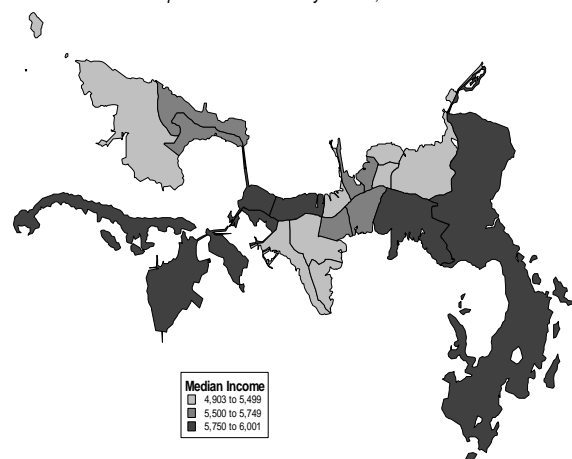

Figure 13.3a. Per Capita Income, Palau and Koror: 2004:2005  
Per Capita Income by State: 2005

Per Capita Income in 2004 by Hamlet, Koror: 2005

As expected, median income for individuals 15 years and older generally increased with age through 55 to 59 years, then decreased with age for most of the remaining age groups (Table 13.6 and Figure 13.4). Median income for females followed a similar pattern. The mean incomes followed a similar pattern.

Source: OPS, 2005 Census, Table 134

Notes: Medians and means in 2004 dollars.

Mean 2004 income figures for five-year age groups were similar to those documented for median income. For all persons, mean income increased through 55-59 years when it approached \$12,500, subsequently declining. Mean income by age followed a similar pattern for males, also reaching a maximum for individuals aged 55-59 years before declining. In contrast, the mean 2004 income for females increased through ages 50-54 years before declining. In some cases, mean female income was greater than mean male income.

The median income for Palau-born individuals in 2004 exceeded the median for those born outside Palau, with the exception of those whose birthplace was some places in Asia (Table 13.7 and Figure 13.5). In general, for most birthplaces, males had higher incomes than females both for individuals born in Palau and for individuals born elsewhere. Mean 2004 income similarly was higher for Palau-born persons than for those born elsewhere, the differences once again substantial. The mean income of males exceeded that of females for all birthplaces, except for Guam.

Note: Medians and means in 2004 dollars.

The median income in 2004 for persons who spoke Palauan at home was about \$1,350 more than the median for everyone 15 years and over (Table 13.8). Those speaking Palauan had a median income of nearly \$5,850, more than twice the value of those speaking English at home. The 2004 median income for persons speaking a Filipino language at home was less than \$3,600. Mean 1999 incomes exceeded median 1999 incomes for language use. As before, Japanese and Korean speakers had the highest incomes, Micronesian speakers among the lowest incomes.

In general, a direct relationship existed between educational attainment and personal income for individuals who at least had high school diplomas: the greater a person's education, the greater his or her income (Table 13.9 and Figure 13.6). The median income for high school graduates was more than \$4,600 in 2004, increasing steadily for other levels of educational attainment to more than \$22,600 for persons with more than a Bachelor's degree. The same general patterns held for mean 2004 income, with the mean reaching more than \$27,700 for individuals with graduate degrees. Median incomes for individuals without a high school diploma tended to fluctuate when compared with educational attainment, exceeding \$5,000 for individuals with one year of high school before declining once again. Mean incomes similarly fluctuated for individuals who had not obtained a high school degree.

Median incomes in 2004 for females were similar to median incomes for all persons by educational attainment — that is, considerable income fluctuation for levels of education below a high school diploma, and increasing income as educational attainment increased for females with a high school diploma or more education. Median incomes of females were lower than those of the total population for all levels of educational attainment except for "Some college" and Associate degrees, showing that the median income for males exceeded female income in nearly all educational categories. Mean 2004 incomes fluctuated for both males and females with less than a high school diploma, and then generally increased with education for individuals who had completed high school or had additional formal schooling. Mean 2004 income of males generally exceeded that of females.

Of all the occupations shown here, persons in managerial and professional positions had the highest incomes in 2004, with a median in excess of \$11,200 (Table 13.10). The median income for persons with technical, sales, and administrative support jobs also was relatively high, exceeding the total median by \$2,300. Female median income was higher than male median income, for the total, and for several of the categories as well.

Table 13.10. Income (Median &amp; Mean) in 2004 by Occupation for 16 years &amp; over by Sex: 2005

Occupation	Number			Median			Mean		
	Total	Male	Female	Total	Male	Female	Total	Male	Female

Source: OPS, 2005 Census, Table 144

Note: \*\*Unknown for 2005 only, people who did not state their occupation

Mean 2004 income by occupation showed a pattern similar to that for median income—that is, higher figures for "managerial ..." and "technical, ..." occupations than the mean for the total population. Similarly, mean male income for 2004 exceeded the mean female income for all occupational categories, except for farming, fishing, and forestry. As with other topics in this chapter, mean incomes were higher than median incomes.

Table 13.11. Income (Median &amp; Mean) in 2004 by Class of Worker for 16 years &amp; over by Sex: 2005

Class of Worker	Number			Median			Mean		
	Total	Male	Female	Total	Male	Female	Total	Male	Female
Total, 16 + years:	9,777	5,982	3,795	5,489	5,416	5,678	7,758	7,956	7,445

Unpaid family	11	6	5	1,500	1,500	1,500	4,410	3,802	5,140

Source: OPS, 2005 Census, Table 144

Extremely high percentage of employed individuals worked for some government agency. Much of the explanation for this situation lies in the income levels available for government jobs compared to private sector and self-employment. In 2004, the median income for private sector jobs (for profit and not for profit jobs) was substantially less than the medians for government jobs (Table 13.11). Median incomes for self-employed individuals fell between the medians for private sector and government jobs. The median 2004 income for females in government exceeded the median income for males in this category, showing general improvement in income for females.

Mean 2004 incomes by class of worker were similar to the median incomes just discussed in that government jobs paid much better than private sector jobs. Workers in the National government earned about twice as much on average as those in State governments, but about the same as those working for the U.S. other governments.

Most families in Palau contained two or more workers in 2005 (62 percent), with 9 percent containing no workers (Table 13.12). The number of workers per family varied among states, although most families in most states also contained two or more workers. Koror had two-thirds of the two or more worker families even though in only had 63 percent of the families. Extreme values in state-level statistics often reflect the small populations living in certain jurisdictions — Hatohobei contained only 8 families in 2005.

Table 13.12. Workers in Family for Families with Income by State: 2005

So, most families in Palau had two or more workers in 2000. As expected, the number of workers in a family influenced family income — with more workers generating higher mean incomes (Table 13.13). Families with no workers had particularly low mean incomes, their finances determined primarily by government funds, like welfare, and financial contributions by relatives.

As discussed earlier in this chapter, 2004 mean family income was highest in Koror State — with rural states tending to have much lower mean family incomes. For all states, families with more workers had higher mean 2004 incomes. However, these incomes varied considerably by state. The mean income with one worker was highest in Koror State, as would be expected. In contrast, Hatohobei had a one worker family income below \$5,000. For two or more worker families, Koror was also highest, at almost \$30,000 per family. The mean for two or more worker families in Ngchesar was less than \$10,000.

### Poverty

The U.S. poverty definition does not work very well in Palau, where the minimum wage is much lower, many people live at least partially by subsistence, and housing conditions differ considerably from those found in the U.S. Nevertheless, we use this definition to evaluate income in Palau to provide comparable statistics. By the U.S. definition, about 53 percent of the families and about 59 percent of the persons living in Palau in 2005 were in poverty in 2004 (Table 13.14).

The state income levels discussed earlier for families and individuals obviously influence the geographic patterns of poverty. Koror and Airai States, with the highest family income, also had the lowest percentage of families below the poverty line (about 41 and 58 percent, respectively). States with lower income levels had higher percentages of persons in poverty. All families living in Hatohobei had incomes below the U.S. poverty line. Personal poverty levels were similar to those for families. About 3 out of every 5 people in Palau in 2004 lived in U.S. defined poverty. About half of the persons living in Koror State in 2005 fell below the poverty line in 2004.

Table 13.13. Mean Income in 2004 for Families with Income by Workers in Family and State: 2005

Table 13.15 shows poverty ratios, once again based on the U.S. definition of poverty. The values in the 100% columns are the same as those shown for persons in poverty in Table 13.14. Some U.S. Federal programs require numbers and characteristics of persons living at different levels of poverty. For example, if an administrator needs to have the percentage of persons living at 50 percent of the poverty level, he or she should look at the columns in Table 13.15 with 50% at the top.

Table 13.15. Ratio of Income to Poverty Level in 2004 by State: 2005

Source: OPS, 2005 Census, Table 22

The 50 percent level is obtained by dividing the values in the cells in Table 13.1 by 2 and then determining how many persons or families fall below these new levels. Both the number and the percent of individuals in each state living at 50 percent of poverty is obviously going to be much less than those living at 100 percent of poverty -- these persons may be considered the really poor, poor. On the other hand, some researchers and administrators may want to use these lower levels for analysis to partly account for the role of subsistence in the economy. If the 125 and 200 percent are used, more people are included, so the numbers and percents of persons at these levels increase. That is, for a program which requires numbers of persons at 200 percent of poverty or below — that is, if the poverty level was set at \$10,000, then we would be looking at persons or families making \$20,000 or less — then, obviously more people are included.

## Conclusions

As Palau's economy changes from subsistence based to market based, financial accumulation and dispersion of money are becoming increasingly important. This transition rarely occurs smoothly at the national level and Palau is no exception. Income dropped in real terms between 1994 and 2004. Most annual incomes for Palau's residents in 2004 placed below the U.S. defined poverty line.

Palau's economic base is developing, and the data here show many of the characteristics of that development. The data show, for example, a direct relationship between the level of educational attainment and income. Development programs which enable higher education attainment and increased skills should promote Palau's economic development. The important economic role of government employment, on the other hand, could delay development. Government employment still pays much better than most private sector jobs. Because of this discrepancy, individuals will continue to search most actively for government jobs, increasing the pressure on this sector of the economy with more difficult economic times. In attracting many of the best and brightest in Palau, government employment removes people with important skills from other sectors of the economy — delaying the development of a more broadly based, self-sufficient economy.

## CHAPTER 14. ESTIMATES AND PROJECTIONS

Population and housing censuses provide the crucial sources of data on the size, structure, and distribution of population and housing, but are taken only periodically. Censuses require tremendous expenditures of money and human energy at all phases — planning, enumeration, compilation, analysis, and publication. Because the Government of Palau needs information about the size and structure of the republic's population between censuses to address its needs, estimates of the population between censuses and projections are important planning tools. Data from recent censuses, surveys, and other sources of statistical data can be used to prepare estimates between complete population counts. Data from recent censuses and compilations of vital statistics, in turn, can be used to prepare population projections — providing information on likely future challenges to the republic and its government.

In this chapter we discuss post-censal estimates and projections for the years following 2005. Estimates and projections use census, survey, and administrative records and assumptions for their foundations. Obviously, the accuracy of these calculations depends on the quality of the data and assumptions used to prepare them. The initial data used as the base from which to make post-censal population estimates and projections should have no errors. The components of population change — fertility, mortality, and migration — are likely to follow certain courses. Assumptions, which deviate from the actual courses of these components, will reduce the accuracy of the estimate or projection. Furthermore, as the period of a post-censal population estimate or projection increases, the likelihood of error similarly increases, for the assumptions on which the calculations are based may not hold for long periods. Ultimately, the accuracy of population estimates or projections tends to depend more on the extent to which underlying assumptions prove correct than the level of sophistication of the method used to compute the figures. The information on estimates and projections presented in this monograph, particularly the information for fertility and mortality, come directly from the data in the 2005 Census and or vital registration.

### Projection Method

The International Programs Center at the U.S. Census Bureau has developed a program called *Rural Urban Projections* (RUP) to project populations for countries around the world. The RUP program employs a cohort component method which projects each age and sex group over time based on the three main components of population change. Annual births and deaths and migration create new numbers — either increasing or decreasing cohort size — depending on the contribution of each component.

Certain features of the RUP program enable considerable flexibility for specifying projected trends in fertility, mortality, and migration. The program also permits a range of output options giving a detailed examination of the results.

The features of the RUP program used for the population projections in this chapter include the following:

- The program produces projections by single years of age. This feature allows use of special age groups that are not conventional five-year age groups. It also allows tracking population cohorts that may be smaller or larger than surrounding cohorts due to past demographic events. In the projections prepared here, we use data on single years of age by sex collected by the 2000 census.
- The program produces annual projections. This feature enables the inputting of information on demographic events for a particular year (e.g., excess mortality due to a typhoon or tidal wave) without spreading the effect over a five-year period. It also provides planners with projections for each year rather than requiring interpolations between projections for surrounding years.
- In addition to accepting mortality and fertility rates as input (as do most programs), the RUP program also allows the input of numbers of births, deaths, or migrants. This feature enables updating a base population with recent actual data on vital events. For instance, because in addition to the 1990, 1995, 2000 and 2005 censuses, we have available information on registered births by age of mother and deaths by age and sex for years before the census, we can include these vital statistics in the projection without having to estimate associated fertility and mortality rates. We project the census populations by age and sex using life tables consistent with the numbers of deaths (by age and sex) and mortality patterns for surrounding years, age-specific fertility rates consistent with numbers of births (by age of mother), and the known number of migrants reported in the censuses. For subsequent years, the

program uses the projected trends of these components to calculate future populations. The program provides output of a wide variety of demographic measures for any specified year of the projection. These outputs include:

- Population by age and sex (single years, five-year age groups, special groups) and summary measures of age (e.g., percentages, sex ratios, median ages, dependency ratios);
- Summary rates (e.g., crude birth rates, life expectancy at birth, infant mortality rates, and total fertility rates);
  - Life tables;
  - Net numbers of migrants or migration rates by age and sex;
  - Number of deaths, by age and sex; and
  - Number of births, by age of mother, and age-specific fertility rates.

The flexibility of the RUP package allows a researcher to create a projection model that accurately reflects what is known about the demographic situation in a particular country, making maximum use of available data in a form as close as possible to the original. However, "this flexibility comes at a price as it places a burden on the user (1) to decide on the best way to model the situation (since the program does not limit the options) and (2) to provide accurate data for all the inputs required to run the program."

### Analysis of Population Projections

As discussed in the chapters of this monograph dealing with various demographic topics, the population dynamics of Palau recently have been quite volatile, particularly in the area of migration. Although the population remained around 12,000 persons for more than a decade, immigration caused fairly rapid growth in the years between 1980 and 2000 — to more than 15,000 in 1990 and more than 19,000 in 2000 before rising less slowly between 2000 and 2005. Almost all of the population increase in the 1990s was due to net immigration, but after 2000, Palau experienced net out-migration. Although Palauans continued to leave Palau, additional emigrants between 2000 and 2005 added to the flow. Nonetheless, the population continued to increase because of the surplus of births over deaths and a small amount of net immigration.

Similarly, as discussed in Chapter 6, fertility continues to decrease rapidly, although the exact extent of the continued decrease is unknown. The current total fertility rate (TFR) of 1.9 children is one of the lowest in the Pacific as well as the world. It is not clear whether the Asian immigrants have lower or higher fertility than the Palauans, nor is it clear whether the current level of fertility for the immigrants would continue after arriving in Palau.

Chapters 6 and 7 examine birth and death rates for Palau in detail; Table 14.1 summarizes some of these measures as derived from the RUP program. The table shows expectation at birth by sex, and infant mortality rates, as well as estimated total fertility. Crude birth and death rates and migration rates are presented in later sections.

Table 14.1. Summary Measures for Projections based on Palau Census: 2005

Year	Expectation of life at birth			Infant mortality rate			Total Fertility Rate
	Both sexes	Male	Female	Both sexes	Male	Female	
2005	72.49	69.54	75.60	21.49	14.30	29.10	2.18
2010	70.98	68.09	74.05	26.56	16.50	37.23	1.70
2015	72.38	69.44	75.50	21.81	14.45	29.60	1.70
2020	73.68	70.70	76.83	17.98	12.67	23.60	1.70
2025	74.88	71.87	78.06	14.91	11.14	18.90	1.70

Table 14.2. Age-specific & Total Fertility Rates for Projections

Age Group	Age-specific Fertility Rate
15 to 19 years	24
20 to 24 years	114
25 to 29 years	105
30 to 34 years	75
35 to 39 years	44
40 to 44 years	19
45 to 49 years	0
Total Fertility Rate	1,905

Source: U.S. Census Bureau International Data Base

The age-specific fertility rates used in the projections were derived from the vital registration data (for the numerators) and the 2005 census results (for denominators), as discussed in Chapter 6. Table 14.2 presents these measures again, for reference purposes. Because the birth rates already are low, the projections assumed unchanging fertility (though we speculated about continued fertility decline in Chapter 6).

Life expectancy at birth was estimated to be about 69 years for both sexes combined in Chapter 7, although RUP estimated the rates slightly higher, as seen in table 14.1. These levels probably are higher than the actual life expectancy in the republic, but it is important to remember that the majority of Palau's population lives close to the hospital and receives mostly free or low-cost medical (out-patient) attention and medicine. Moreover, it is unlikely that registered deaths include all deaths of Palauans, particularly those leaving the republic for medical attention and dying elsewhere. Infant mortality was measured at about 18 infant deaths per 1,000 live births.

Note: The Census Bureau rounded the data for Guam and CNMI so they don't sum.

persons who left Palau and were outside the republic in 1995, but had returned by 2000. On the other hand, we assumed about an equal number of non-Palauans to have been in Palau in 1995, but left Palau by 2000.

We estimated migration indirectly, since the Republic of Palau does not collect data on immigrants and emigrants. Obtaining information on immigrants was fairly straightforward. Because Guam and CNMI, the two biggest places of out-migration for Palauans, did not take a Census in 2005, we continued to use estimates from the 2000 Censuses. After the 2000 census, we chose to use the number of persons not living in Palau in 1995, but enumerated in the census in 2000. For example, Table 14.3 shows 3,022 males who lived outside Palau in 1995 but in Palau in 2000.

Some of these individuals might have been Palau-born

For emigrants from Palau, we used tables similar to Table 14.3 from the 2000 Censuses of Guam and the CNMI — thus assuming that all out-migration of Palauans was to these two areas. This assumption admittedly is inaccurate; as discussed in Chapter 8, many Palauans also migrated to the U.S. and other places when, for example, they join the Armed Forces. Unfortunately, we had no information on destinations other than Guam and the CNMI of Palauan emigrants when preparing these projections. We found 185 males living in Palau in 1995, but living in either Guam (105) or the CNMI (80) in 1990. These figures do not represent all of the total Palauans living in the Marianas, which would be much higher; in fact, the number of Palau-born in Guam and CNMI was higher in previous censuses. If a male moved from Palau to Guam before 1995 he would not be included here despite being an emigrant to one of the two destinations of interest. In all, for example, about 2,800 more males migrated to Palau between 1995 and 2000 than migrated to Guam or the CNMI, making net immigration roughly 1,000. Since the period from 1995 to 2000 was five years, the average annual immigration of males for the last half of the 1990s was about 550.

About the same number of females as males moved from Palau to Guam or the CNMI between 1995 and 2000 (Table 14.4). However, many fewer females than males migrated to Palau — about 1766 during the five-year period. Combining immigration and emigration figures for females yielded a net immigration of about 1,546 between 1995 and 2000, or about 300 per year. Net annual in-migration of males and females combined during the last half of the 1990s averaged about 850 persons during the last half of the 1980s.

Table 14.4. Female Migration between 1995 &amp; 2000 of Palau Born to Guam &amp; CNMI &amp; from Outside to Palau: 2000

Source: U.S. Census Bureau International Data Base

until about 2010, when it would plateau.

The estimated midyear population for Palau in 2005 was 20,687 persons (Table 14.5). This value is different from the 19,907 census result because of the shift to mid-year (July 1) from April 1 (the census date). The growth rate gradually declines during the period — both for the past, with the actual figures, and into the future, with the projected figures. The Census Bureau assumes decreasing net immigration over time, until migration is offset by natural growth after 2010. These assumptions don't follow the current actual practices which include much larger immigration than emigration. But, with these assumptions, the population would continue increasing

Table 14.6 shows continuously declining crude birth rates, and gradually increasing death rates as the population ages (and is not replaced with younger people through births or net immigration). Net immigration, in fact, is shown to stop after 2010, so natural growth rates and total growth rates are the same after that, and negative later in the century. Note that because of the small population increase between 2000 and 2005, the increase in subsequent years will be smaller than in the past (actual) values. These figures all assume that the pattern between 2000 and 2005 will continue.

Table 14.6. Population and Growth Rates: 1980 to 2025

Year	Population	Crude Birth Rate	Crude Death Rate	Migration Rate-Net	Natural Growth Rate	Total Growth Rate
1980	13,311	22.24	7.06	(8.20)	1.52	0.70
1985	13,804	24.42	6.88	(8.23)	1.75	0.93
1990	15,207	21.44	7.69	9.34	1.38	2.31
1995	17,153	23.26	6.41	8.28	1.69	2.51
2000	19,257	13.45	6.85	13.03	0.66	1.96
2005	20,687	14.60	6.48	6.86	0.81	1.50
2010	21,651	11.13	7.02	-	0.41	0.41
2015	22,112	11.40	7.05	-	0.44	0.43
2020	22,593	11.73	7.61	-	0.41	0.41
2025	22,994	11.22	8.44	-	0.28	0.28

Source: U.S. Census Bureau International Data Base

Table 14.7 shows the population distribution for midyear 2010 (July 1). About 6 percent of the population would be less than five years of age and less than 25 percent was less than 15 years of age. At the other end of the age distribution, about 8 percent of the population would be 65 years and over. Finally, about 122 males would be residing in Palau in 2010 for every 100 females. As seen below in Figure 14.1, the population structure is no a traditional period, mostly because the current very low fertility, which is likely to continue into the future. However, it will take some time for the effects to “trickle up” into the older age groups. The percentage of elderly will also rise since the population is aging, as seen in the increasing life expectancy and median ages.

Table 14.7. Population by Age and Sex: 2010

Age Group	Number			Percents			Males per 100 Females

Continuing on to 2020, the portion of Palau's population aged less than five years is projected to remain at about 6 percent in 2020, as would the percentage of the population younger than 15 years (Table 14.8). The percentage of individuals older than 65 years would increase slightly. The median age of the population projected for 2020 is 37.8 years. See also Figures 14.1 and 14.2.

The demographic changes projected for the first half of this century is expected to continue — becoming less pronounced as the population grows through natural increase while the number of annual in-migrants stops. Fertility is expected to hover around 1.7. The life expectancy at birth is projected to rise steadily through the 70s during the next 30 years while the infant mortality rate falls to below 10 by 2015. The two pyramids in Figures 14.1 and 14.2 show a population with low fertility, continued low mortality, and selective immigration.

Figure 14.1. Palau: 2010

Figure 14.2. Palau: 2020

## Conclusions

Here we present one set of population projections for the Republic of Palau, beginning with the 2005 census and continuing for several decades. Key characteristics of the population are likely to change, with increasing numbers of working age persons, growth in the overall age of the population, and an increasing male-female ratio. The growing age of Palau's population with time, coupled with the relative increase in males over females, help to explain the projected changes in fertility and mortality.

The discussion on population projections is necessarily brief. Since the OPS intends to prepare additional projections (as well as post-censal estimates) based on differing series of fertility and migration assumptions, the projections here are illustrative, providing an example of likely population increase in Palau over the coming decades if current trends in fertility, mortality, and migration continue.

---

## CHAPTER 15. HOUSING CHARACTERISTICS

The study of housing characteristics is important because everyone must live somewhere. Studying various aspects of housing provides important insights for development — often showing relationships between traditional cultural systems and modernization. The 2005 census of Palau acknowledged the important role played by housing by collecting and presenting data on various aspects of the republic's housing stock.

We have organized this examination of housing characteristics into four major sections:

- general housing characteristics (total counts of various unit types, tenure, vacancy characteristics, and age);
- structural characteristics (number of housing units per structure, rooms per housing unit, and bedrooms per housing unit; material used for the construction of roofs, outer walls, and foundations);
- utilities (electricity, water, and sewer); and
- equipment (general plumbing; toilet, bathing, and kitchen facilities).

We present definitions and the related considerations of data limitations and comparability, to assist in understanding description and analysis of the housing characteristics. These definitions draw heavily on the information presented in Volume I of the report on the 2005 Republic of Palau Census of Population and Housing. The most pervasive data limitation concerns comparisons between census years; housing data presented for 1980 typically concerned year-round housing units, while data presented for 1986 considered only occupied units and those presented for 1990, 1995, 2000 and 2005 concern total housing units (and occasionally occupied housing units by tenure). Because the 1986 census report did not contain detailed definitions for housing characteristics (see OPS, 1987, pp. 10-12), and the 1980, 1990, 1995, 2000 and 2005 censuses are used in comparison. In general, we present data for total housing units – occasionally deviating from this trend for comparisons between 2005 and earlier censuses.

### Data Description

#### *General Housing Characteristics*

A *housing unit* is a house, apartment, mobile home or trailer, or group of rooms or single room occupied as separate living quarters — or, if vacant, intended for occupancy as a separate living quarters. Separate living quarters are those in which the occupants live and eat apart from any other persons in the building and have direct access only from outside the building or through a common hall. If living quarters contained ten or more unrelated persons the 1990 and subsequent censuses classified them as *group quarters*. If living quarters contained nine or fewer persons unrelated to the householder or person in charge, the census recorded them as a housing unit. This chapter deals exclusively with housing units.

The 2005 census included both occupied and vacant housing units as part of the housing inventory. It included recreational vehicles, boats, vans, tents, etc. only if used as usual place of residence on Census Day 2005. The census classified a housing unit as *occupied* if it was the usual residence of the person or group of persons at the time of enumeration, or if the occupants were only temporarily absent. The census included vacant mobile homes provided that they were intended for occupancy.

A *vacant* housing unit was one that contained no residents at the time of enumeration, unless its occupants were only temporarily absent. The census also considered vacant those units temporarily occupied at the time of enumeration by persons who usually resided elsewhere. A new unit not yet occupied was classified as vacant if construction had reached the point where all exterior windows and doors, and final usable floors, were in place. The census did not consider unoccupied units open to the elements as vacant. Also excluded from vacant units were buildings used entirely for non-residential purposes, like a store, office, or storage facility.

Item H3 on the 2005 census distinguished between owner-occupied and renter-occupied housing units, or *tenure*. The census classified a housing unit as *owner-occupied* if the owner or co-owner resided in the unit on census day, even if the unit was mortgaged or not fully paid for. The remaining occupied housing units were classified as *renter-occupied*, regardless of whether cash was paid. The census recorded a housing unit as *Rented for cash rent* if any money rent was paid or contracted for; this rent could come from individuals either living in the unit or elsewhere, or from an organization. Rental units classified under *No cash rent* generally were those provided free by friends or relatives, or in

---

exchange for services like those provided by a resident manager.

The 2005 census defined the *homeowner vacancy rate* as the percentage of the total homeowner inventory vacant and for sale. *Rental vacancy rate*, in turn, was the percentage of the total rental inventory vacant and for rent.

Questionnaire item H8 concerned the year the structure was built. Census personnel tried to obtain year of construction for both occupied and vacant housing units. Data on the year built refer to when the building was first constructed, not when it was remodeled, added to, or converted. Recently built structures that met the housing unit definitional requirements (all exterior windows, doors, and final usable floors installed) were assigned to the *1999 to March 2000* category.

Limitations. The 2005 census data concerning housing unit definitions, tenure, and occupancy status contain no particular limitations. Data on the year built are more susceptible to errors of response and non-reporting than the other general housing characteristics considered in this chapter, as respondents relied on their memory or on estimates of other persons familiar with their housing unit. Evidence shows that respondents often underreport year of construction of older units.

Comparability. There was no change in the definition of housing units or occupancy status between the 1980, 1990, 1995, 2000 and 2005 censuses. The Census offices began collecting data on tenure for housing in Palau in 1970. The 1980 decennial census reported tenure only for year-round housing units — units intended for year-round use — a category no longer employed. In addition, the 1990 census expanded response categories to allow respondents to report whether a housing unit was owned with a mortgage or free and clear. Although the intention of this change was to improve the count of owner-occupied units (based on studies of U.S. respondents to earlier censuses), the possible change in count decreases the compatibility between this and previous censuses. The U.S. Census Bureau similarly began collecting data on vacancy status for housing in Palau in 1970. Census reports through 1980 once again presented these data only for year-round housing units. For 1990, the category "Seasonal/recreational/occasional use" combined unoccupied units classified in 1980 under "Seasonal or migratory" and "Held for occasional use" categories. Finally, decennial censuses began collecting information on the year a structure was built for housing in Palau in 1970, although these data were shown only for year-round housing units through 1980. The 1990 and subsequent census reports presented these data for all housing units, in the process adding appropriate response categories to accommodate units built during the intervening periods. Recent censuses have added a category "Don't know" in an effort to minimize the response error on year of construction, as discussed above.

### *Structural Characteristics*

The 2005 census obtained information on the number of housing units in a structure from questionnaire item H2, recorded for all housing units. In the Republic of Palau, a structure comprised a separate building that either had open space on all four sides or was separated from other structures by dividing walls that extended from ground to roof.

Type of Structure. The statistics presented in the 2005 census report that refer to the number of housing units in separate structures of specified type and size consider the following categories:

- *One family house, detached* – a single-unit structure detached from any other structure (except a shed or garage). A one-family house that contained a business was considered detached as long as the building had open space on all four sides. Mobile homes or trailers to which one or more permanent rooms have been added or built also were classified under this category.
- *One family house, attached* – a one-unit structure that had one or more walls extending from ground to roof separating it from adjoining structures. In row houses and townhouses, double houses, and houses attached to non-residential structures, each housing unit was an individual attached structure if the dividing or common wall extended from ground to roof.
- *Building with two or more apartments* – housing units in structures containing two or more housing units, further categorized as units in structures with two, three or four, five to nine, 10 to 19, 20 to 49, and 50 or more units.

- *Boat, houseboat or yacht* – questions asked for people living on boats or houseboats, also known as “live-aboards” and yachts.
- *Other* – any housing unit that did not fit the previous categories, like abandoned cars, campers, vans, and shacks.

*Rooms.* The 2005 census obtained information on the number of rooms per housing unit from questionnaire item H12, with resulting information recorded both for occupied and vacant housing units. The intent of this question was to count the number of whole rooms used for living purposes. For each unit, whole rooms included living rooms, dining rooms, kitchens, bedrooms, finished recreation rooms, enclosed porches suitable for year-round use, and lodger's rooms. Excluded were kitchenettes, strip or Pullman kitchens, bathrooms, open porches, balconies, halls or foyers, utility rooms, unfinished attics or basements, and other unfinished space used for storage.

*Bedrooms.* Data on bedrooms were obtained from questionnaire item H13, with resulting information recorded for both occupied and vacant housing units. The number of bedrooms refers to the count of rooms designed to be used as bedrooms — the number of rooms that one would count as bedrooms when listing a housing unit for sale or for rent. The 2005 census included as bedrooms all rooms *intended* for use as bedrooms even if residents were using them for some other purpose on Census Day. Housing units comprising a single room, like an efficiency apartment, by definition were classified as having no bedroom.

*Roof.* The census collected data on the material used for the roofs of housing units with questionnaire item H10; the results recorded both for occupied and vacant housing units. The census classified each housing unit according to the type of material used most in the construction of its roof. The material categories employed were "Poured concrete," "Metal" (including zinc, steel, tin, etc.), "Wood" (including woodboard, plywood, etc.), "Thatch" (including sugar cane leaves, palm or pandanus thatch, palm leaves, straw, etc.), and "Other" — the last category accounting for all materials not covered by the previous four categories.

*Walls.* Information on the material used for the outside walls of housing units was obtained from questionnaire item H9, once again both for occupied and vacant housing units. The census classified each unit according to the type of material used most in the construction of its outside walls. Separate categories included as "Poured concrete," "Concrete blocks" (including those where plaster cement covered the wall), "Metal" (including zinc, steel, tin, etc.), "Wood" (including wood board, plywood, etc.), and "Other" — the latter once more accounting for all construction materials not covered by the four specific categories.

*Foundation.* The 2005 census collected data on type of material used for the foundation of housing units with questionnaire item H11, both for occupied and vacant housing units. Census personnel classified each housing unit according to the type of material used most in its foundation. The categories employed were "Concrete," "Wood pier or pilings," and "Other" — the latter comprising units with foundations built with materials that could not be described by the first two categories as well as units with no foundation.

Limitations. No apparent limitations affect any of the structural characteristics considered in this report.

Comparability. The Census offices first collected information on the number of units per structure in Palau in 1970 — reporting the results only for year-round housing units through 1980, in contrast to the total units reported in 1990. Data on the number of rooms per unit, similarly collected in Palau for the first time in 1970, were shown for year-round housing units through 1980 and for all housing units in 1990. Data on the number of bedrooms were first collected for Palau in 1980. The 1980 definition of a bedroom *excluded* rooms designed for use as a bedroom but employed for some other purpose (though tests conducted with data from the U.S. revealed virtually no differences in the information obtained with these different questions). As with data on all rooms, bedroom statistics were shown only for year-round units in 1980 and for all housing units in 1990. Information on the material used for roofs and outside walls were collected for the first time in 1980 and shown only for year-round units — as opposed to data on all housing units presented in the 1990, 1995, 2000 and 2005 census reports. Data on the material used for foundations were collected for the first time in 1990.

---

## Utilities

**Electricity.** The 2005 census collected data on electric power with questionnaire item H18, recorded both for occupied and vacant housing units. The census considered units to have electric power if they were so equipped — even if the current was shut off for some reason.

**Source of Water.** Data on source of water were obtained from questionnaire item H23, also recorded for occupied and vacant housing units. In Palau, common source supplying water through underground pipes to five or more units was classified as "Public (government) system only;" this included water supplied by a municipal water system, water district, or water company as well as water from a well that supplied five or more housing units. A water source classified as "Public (government) system and catchments," in turn, described those instances where running water came from a public (government) system *and* some type of catchments system. Housing units receiving water from a well located on the same property or nearby that serves four or fewer housing units were classified under the "Individual well" category. Included in this last type were units receiving well water that was hand drawn, wind drawn, or engine drawn; piped or not piped; and stored in tanks or used directly from the well. A housing unit was classified under "Catchments, tanks, or drums only" if the sole source of water was rainwater collected in the named equipment. Housing units whose source of water was a "Public standpipe or street hydrant" comprised those receiving water from an elevated tank, vertical storage cylinder, or street hydrant that was connected to a public system. Finally, residential units receiving water privately from springs, rivers, irrigation canals, creeks, or other sources not included in the preceding six categories were classified under "Some other source...."

Data on *water supply*, also referred to as "Piped water" and closely associated with source of water, were obtained from questionnaire items H14 to H17 and H23 to H26 and H31 — recorded both for occupied and unoccupied housing units. Piped water signified a housing unit where water was available at a sink, wash basin, bathtub, or shower. The piped water may have been located within a housing unit, in a hallway associated with the unit, or in a room used by several other households in the building containing the unit (even if occupants had to go outdoors to reach that part of the building). If both hot and cold water were available, the census recorded the type of energy used by the water heater ("Electricity," "Gas," "Solar," or "Other fuels"). The census did not categorize as hot water that supplied by an electric faucet attachment at the kitchen sink, an electric shower attachment, or other similar equipment.

**Sewage.** The census obtained data on sewage disposal from questionnaire item H26, recorded both for occupied and vacant housing units. Housing units were classified as connected to a "Public sewer," connected to a "Septic tank or cesspool," or disposing of sewage by "Other means." A public sewer may be operated by a government body or by a private organization. A housing unit was considered connected to a septic tank or cesspool when it had an underground pit or tank for sewage disposal. The *other* category included housing units that disposed of sewage in any manner not covered by the other two specific categories.

**Limitations.** No apparent limitations affect any of the utility characteristics considered in this report.

**Comparability.** The 1980 census asked a question on electrical power, supplier, and source, but reported these data only for year-round housing units; the 1990, 1995, 2000 and 2005 censuses recorded these data for all housing units. Data on source of water similarly were collected beginning in 1980, but reported for year-round units in that year instead of the total units used in 1990 and later. Data on water supply and sewage disposal were collected and reported similarly for year-round units in 1980 and total units in 1990, 1995, 2000 and 2005.

## Equipment

The 2005 census obtained information on plumbing facilities from questionnaire items H14 to H17 for occupied and unoccupied housing units. In Palau, a unit was considered to have complete plumbing facilities when it had piped water, a flush toilet, and a bathtub or shower — regardless if these facilities were located in the unit being enumerated or inside the building that contained that unit.

Data on *sinks with piped water* were obtained from questionnaire item H31, recorded for both occupied and vacant housing units. For classification as a housing unit possessing a sink with piped water, the sink must be in the unit itself or inside the building containing the housing unit enumerated.

Questionnaire items H17 addressed the *type of toilet facilities* both in occupied and vacant housing units. A flush toilet

consisted of any toilet connected to piped water and emptied into a public sewer, septic tank, or cesspool. If the unit did not have a flush toilet, the census asked a respondent to identify the type of toilet facility in his or her housing unit — categorized as "Outhouse or privy" or "Other or none."

The 2005 census collected data on bathtub or shower with questionnaire item H16 both for occupied and vacant housing units. A bathtub or shower was counted only if connected permanently to piped running water — thus excluding equipment like portable bathtubs.

Questionnaire items H27 concerned *cooking facilities* and were asked at both occupied and vacant housing units. Main cooking facilities were those used most often for the preparation of meals; they could be located either "Inside" or "Outside" the housing unit enumerated or in the building containing that housing unit. The 2005 census classified units with cooking facilities according to the energy used to power them, although the present study does not consider this information. A housing unit with "No cooking facilities" comprised a unit with no cooking facilities available either inside or outside the building containing it.

Finally, the census obtained data on *refrigerators* from questionnaire item H30, recorded for occupied and vacant housing units. A refrigerator could be located in the housing unit enumerated or in a kitchen elsewhere in the building containing the unit. Housing units with "No refrigerator" were those utilizing any type of cooling system other than an electric or gas refrigerator, as well units that did not possess this appliance.

**Limitations.** No apparent limitations affect any of the equipment characteristics considered in this report.

**Comparability.** All data related to plumbing were reported for year-round housing units in 1980 and for total housing units in 1990, 1995, 2000 and 2005. Information on cooking facilities in Palau similarly was collected first in 1980; data were reported for year-round housing units in 1980 and all housing units in 1990. The 1980 census distinguished between mechanical and ice refrigerators that it reported for year-round housing units. In 1990 and later, the census distinguished between electric and gas refrigerators, classifying units with ice refrigerators under "No refrigerator" and reporting the results for total housing units.

### Analysis of Housing Characteristics Data

Figure 15.1. General Housing Characteristics; Palau and Koror: 2005

The 2005 Republic of Palau census recorded 4,707 occupied housing units, an increase of 41 percent over the 3,350 reported units reported in the 2000 census (Table 15.1). The increase between 1995 and 2000 was only 13 percent, so it is possible that some change in interpretation of the definition of a housing unit may have occurred, as well as the expected regular increase in units over time. The number of occupied units, as well as owner- and renter-occupied units, increased between successive censuses. The rental inventory grew until 1995, but then dropped off somewhat in 2000, but rebounded in a big way in 2005. The increase in owner occupied units between 2000 and 2005 was 12 percent, but the increase in rental units was 141 percent.

Table 15.1. Tenure by Occupancy: 1986 to 2005

Tenure	2005	2000	1995	1990	1986
Total:	4,707	3,350	2,973	2,885	2,501
Owner-occupied	3,028	2,654	2,254	2,204	1,823
Renter-occupied	1,679	696	719	681	618
Cash-rent	876	475	379	263	190
No cash rent	803	221	340	418	428
Not stated	-	-	-	-	60

Source: 2000 & 2005 Census, Tbl H01; 1995 Census, Tbl H01, OPS

As Table 15.2 shows, the 648 vacant units enumerated in the 2005, at 12 percent, were a much larger part of the housing inventory than in previous census years. Of course, the definition of a “vacant” unit in the Pacific Islands is more difficult than elsewhere because insulation, heating, and cooling are not required. The previously low vacancy rate thus also translates into a small absolute number of vacant units that could disappear very quickly with slight changes in market conditions; but a 12 percent rate indicates possible housing should additional economic development take place.

In 2005 Koror State contained the majority of all housing units as well as each type of occupied unit in Palau. Housing inventories typically respond to market demand. Much of this demand in Koror probably resulted from the increase in the state's immigrant population during the 1980s and later. In addition, as the center for government and economic activity in the republic, Koror State hosts people temporarily in residence on official activities or business, providing another source of demand for rental housing. The amount of housing in Airai State was a distant second to that of Koror, with the remaining states containing relatively small numbers of each type of housing unit considered.

Table 15.2. Housing Units by Occupancy, Vacancy and State of Residence: 2005

Most houses in Palau were constructed relatively recently (Table 15.3). As of Census Day

2005, about 1 in every 7 of the housing units with the householder knowing the date of construction had been constructed during the 5 years before the census, 1 in 3 during the 1990s, and about 1 in 4 during the 1980s, and the rest before that. Koror State influenced much of the republic-wide residential construction trends. Airai State, with its recent growth in population and housing, contained a relatively large proportion of units constructed in 1990 or later.

Table 15.4 shows the year the householder moved into the housing unit. About 18 percent of the householders moved into their unit in 2004 or 2005, within about a year of the census. Since 45 percent moved into their units in 2000 or later, and 60 percent in 1995 or later, the majority of householders moved into these specific units within 10 years of the census. The census conventions were that if a house was torn down and rebuilt, the time of initial moving was to be used, but it is

Source: 2005 Census, Table H08, OPS

difficult to assess whether the respondents and enumerators fully grasped this concept. Since buildings in the tropics don't last as long as in other climates, and the large amount of both internal and international migration, it is not surprising that data show much recent movement.

### Structural Characteristics

Table 15.5. Occupied Housing Units in Structure: 1980 to 2005

Number of Units	Year				
	2005	2000	1995	1990	1980

Notes: (1) Data for 1995 include all housing units comprising occupied and vacant housing units

(2) "Other" in 1995 includes 162 housing units not reported

units was similar to the distribution reported over the two decades. The most evident changes over the decades were relative increases in owner-occupied and a relative decrease in renter-occupied single detached units. The former trend no doubt resulted from the construction boom during the 1980s and 1990s. Despite increasing Western influence and changes in the types of housing available, Palauans continue to live in single, detached units — a unit type particularly suitable for the larger families and fluid residential patterns. The relative decrease in renter-occupied single detached housing units, conversely, was a consequence of the more rapid growth in multi-unit rental property during the 1980s and 1990s.

In 2005, all states in Palau had single, detached occupied housing units — the traditional type of residential structure found in the republic (Table 15.6). Other unit types were much less universal, with most located in Koror. With very few exceptions, Koror State contained all multi-unit residential structures. Few housing units were classified under "Other" — non-traditional housing options chosen by individuals residing in the two most rapidly growing states in the republic. Figure 15.2 shows the percentage in single, detached units for various states and the total. The single, detached unit is the traditional unit, as noted, but as more people turn to apartment living because of lack of land and convenience, Palau is likely to see a change in how many people live. Commuting from an apartment in town now, and to Melekeok later will be easier than long drives from distance single, detached units. Note that the graphic for hamlets in Palau in Figure 15.2, as in the succeeding ones, does not have an accompanying table.

The majority of housing units recorded in the 2005 census of Palau were single, detached structures — about 68 percent (more than 2 of every 3) of all occupied units (Table 15.5). Most of the remaining units were in single attached structures, with multiple-unit structures accounting for all but a few remaining units. The 2005 census counted a few units classified as "other," like campers, vans, and shacks.

Figure 15.2. Percent Living in Single Family, Detached Units

In addition to growth in the total number of housing units in Palau and changes in their types of structures, the size of the structures also changed. In 1980 the median number of rooms per occupied housing unit was only 3.2. Over the decades, this measure increased to 4.0 by 1990, 4.5 in 1995, 4.8 in 2000, and 4.7 in 2005 (Table 15.7 and Figure 15.3). The number of residential units with three or fewer rooms decreased over the same time period, while the number of housing units containing six or more rooms increased. Although many of these changes in Palau's housing stock were due to new construction, the modification of existing units through building additions to existing small structures produced the same result. Whatever the means used to change size, homes had more rooms during the 1990s and 2000s than the 1980s.

The number of rooms per occupied housing unit varied among Palau's states in 2005 (Table 15.8 and Figure 15.4). Koror State, which contained nearly two-thirds of the republic's occupied housing units, also contained units with the largest number of rooms. The median number of rooms in the occupied housing of all other states was less. Housing units with many rooms generally reflect Western influence, helping to account for the difference between Koror, the most Westernized state

in Palau, and the remaining states in the republic — many of the latter, like Hatohobei and Sonsorol, maintaining much of their traditional way of life.

Figure 15.4. Median Rooms and Persons per Room, Koror: 2005

Another measure of housing unit structure is number of bedrooms per unit. As was the case with the number of total rooms per unit, the median number of bedrooms per unit increased after 1980 (Table 15.9). The number of units with no formal bedrooms — traditional Palauan residential structures — declined over the decade while the number of units with one or more bedrooms increased. The biggest percentage increases occurred in housing units with three or more bedrooms, once again probably representing the growing influence of Western culture.

In addition to containing the most housing units in Palau, the state of Koror contained a disproportionate number of units with three or more

In contrast to recent changes in the composition of housing, the materials used to construct housing units in Palau changed relatively little over the decades. Here we focus on three parts of a residential structure — the roof, outside walls, and foundation. In 1980, most roofs of housing units in Palau were metal, a trend that continued throughout the successive censuses (Table 15.11). The portion of housing units with concrete roofs tripled during the 1980s, and increased by about half during the 1990s, accompanying the introduction of new construction methods and the increase of multiple unit structures (most of the latter being built with concrete roofs). The trend continued after 2000. The units with wood or thatch roofs, in contrast, decreased during the two decades. Their decline in absolute numbers of units implies the replacement of roofs that no longer serve their purpose or the replacement of entire older units. Most of the new housing built between 1980 and 2005 had roofs constructed from the latter two materials — the persistence of metal due in part to its much lower cost compared to concrete.

Table 15.12. Occupied Units by Roof Materials & State of Residence: 2005

Note: 1980 data are for year-round units

In 1995, 169 group quarters did not report bedrooms

bedrooms (Table 15.10). This state contained virtually all of the residential units with four or more bedrooms — and relatively few units with zero or one bedroom. More remote places in Palau, probably by virtue of less exposure to Western influence, less accessibility, and generally lower income (making the construction of larger housing units more difficult), had larger proportions of housing units with few or no bedrooms. Because the traditional life style, also, few households feel they must have many bedrooms. Many families and households use their housing units mainly for sleeping, and remain outside for much of the day and evening. Hence, they only go into the house to sleep, and do not require formal sleeping arrangements for all family members. Most of the units with 5 or more bedrooms are in Koror, as would be expected, where more extended family members move to live, work, and go to school.

Koror State is having more modern housing as seen in the material used for roofs. More than 95 percent of the total residential units in this state had roofs of metal or poured concrete (Table 15.12). Virtually all cases of the latter, an indication of modern construction and often a feature of multiple unit residential structures, were found in Koror and Airai states. More remote, rural states contained greater percentages of housing with roofs built from traditional materials — with both wood and thatch recorded under "Other" in Table 15.12. A large percentage of rural housing units had metal roofs. Palau does not have many typhoons, like Guam, the Northern Mariana Islands, and American Samoa, so does not need as strong housing as those areas. Metal roofs provide coverage, are cheaper, and "breathe" better than concrete roofs. However, more and more families seek the status of having a strong house.

The material used for outside walls of residential units also changed after 1980 — a move towards increasingly modern construction. The use of concrete increased between 1980 and 2005, with both larger numbers and percentages of housing units with poured concrete and concrete block walls (Table 15.13). The number and percentage of housing units with walls constructed from wood similarly increased during the decades. Conversely, the frequency of units with walls of metal or "Other" (primarily thatch) materials decreased after 1980. Although metal is not a traditional construction material, its use for residential construction has long been prevalent in Micronesia. Concrete and wood replace metal walls because they are sturdier. They are also more expensive. The slight discrepancies in trends for wall construction in the 1986 data probably are due to differences in definitions and data collection procedures used by the different censuses. (See Figure 15.5 below for percents in graphs)

Figure 15.5. Percent with Concrete Walls, Palau and Koror: 2005

In 2005, most of the housing units in Palau with concrete walls were found in Koror, Airai, and Peleliu states (Table 15.14 and Figure 15.6). Because the first two states have experienced the greatest recent growth in population and housing, it is not unreasonable to expect their residential construction to feature more modern, expensive material. Relatively few housing units in the other rural states of Palau had concrete walls, with the most remote states of Hatohobei and Sonsorol having none at all. The walls of housing units in most rural states were metal, a relatively inexpensive, available, and easily transported alternative to the thatch used in traditional times and the concrete of more modern construction.

The foundations of most housing units in Palau in 2005 were constructed of concrete, with most of the remainder built from wood (Table 15.15). As with other portions of a housing unit, concrete represents a more expensive, modern alternative to traditional materials. However, concrete foundations are much more prevalent throughout most of the republic — probably in part due to their long-established dominance among materials used to construct Western-style housing.

Most of the units with concrete foundations in 2005 were located in Koror, Airai, and Peleliu states. Concrete foundations were much scarcer in the other rural states, with only 2 found in Hatohebei State. The basic tables in Volume I show figures for roof, walls, and foundation together, so should be consulted to see how all three variables are related in Palau. The 1995 and 2000 Censuses also collected this information, so researchers interested in trends can look to those volumes for more information about housing conditions in Palau.

## Utilities

Almost 99 percent of all housing units in Palau had electricity by 2005, this percentage having grown substantially since 1980 (Table 15.16). (The figure for 1995 of 100 percent probably is anomalous, and due to the computer editing procedures.) Because the housing stock also increased rapidly over the same decade, the growing proportion of residential units with electricity shows that most new units had electric power and many units without in 1980 became connected over the next 25 years.

Nearly all of the housing units in Koror State had electricity in 2005 (Table 15.17 and Figure 15.7-preceding page). Electrification was widespread on Babeldaob Island as well, with many units in all states having electric power in 2005. More populated states outside Koror and Babeldaob, like Angaur and Peleliu, also had widespread electrification. Only Hatohebei State did not report using electricity in 2000. To complement data on electric power, Table 15.17 also presents data on other housing indicators. About 35 percent of all units had a microwave oven, a relatively new question on Palau's census form. About 95 percent of the units had a sink with piped water, 86 percent had a telephone, 86 percent had a radio, and 87 percent had television. Two new items appeared on the forms in 2005 – about 45 percent of the housing units had cell phones and about 18 percent had computers. As would be expected, Koror generally had the highest percentage for each of these indicators, usually followed by Airai, and then the other States. More historic detail on selected items appears below.

Table 15.17. Housing Indicators by State of Residence: 2005

Sources: 1990 U.S. Census, 1995, 2000 and 2005 Censuses, OPS

In 1990, only 1 in every 3 units in Palau had at least one telephone (Table 15.18). By 1995, more than half the units had a phone. By 2000, more than 9 in 10 units had phones, but that percentage decreased in 2005, partly because some units had cell phones, so disconnected their land lines.

In 1990, fully 85 percent of Palau's units had a radio. This percentage dropped to 83 percent in 1995, and the absolute numbers increased, suggesting new units for immigrants were not yet equipped with radios. By 2000, about 90 percent of the units had radios, an 87 percent in 2005. The number of units having televisions showed the same explosive growth as telephones. While 58 percent of Palau's units in 1990 had a television, by 1995 that figure grew to 76 percent, and was 86 percent in

2000, and slightly higher in 2005. Many of the remaining units did not have electricity. Furthermore, the percentage of units with air conditioning also increased greatly during the 1990s. In 1990, 14 percent of the units had air conditioning. By 1995, almost 1 in 4 units were equipped, and by 2000, almost 2 in 5. By 2005, more than half of all Palau's units had air conditioning. Of course, this large increase in capacity has implications for the utilities' capacity in the Republic; as more households have more and more appliances, capacity will have to keep up.

Koror had the most occupied units that were air-conditioned (Table 15.19). Palau had 2,518 occupied units (again, about 53 percent) that were not air-conditioned; housing units on Hatohobei reported having air conditioning even though they did not report having electricity, which could be a reporting problem. Figure 15.8 gives us an overall picture of households with no air-conditioning for Palau, and for hamlets in Koror State. Air conditioning is an important indicator for several reasons. In the first place, it indicates amount of comfort in a hot place. However, it is also important as an indicator of wealth, since households who can afford air conditioning, not only the initial cost, but the month maintenance and electricity costs as well, are likely to have other appliances as well. Finally, air conditioning is a measure of energy use and conservation since the government needs to plan for increased energy production based on use patterns.

Figure 15.8. Percent Households with no Air-conditioning: Palau and Koror: 2005

Another important indicator of modern development is water supply. The number of housing units in Palau with piped water more than doubled between 1980 and 1990, and continued the upward trend in the 2000 and 2005 Censuses (Table 15.20). Although the majority of these units had cold water only, the number of units with both hot and cold piped water nearly tripled over the decade of the 1980s, and then more than doubled between 1990 and 2000. In 2005, only 105 units (2 percent of the total) had no piped water, down from 401 housing units (about 12 percent of the total units) in 1990, which in itself was less than half the number without piped water in 1980.

Table 15.20. Occupied Housing Units by Hot and Cold Piped Water: 1980 to 2005

Hot and Cold Piped Water	2005	2000	1995	1990	1980
Total:	4,707	3,350	2,973	3,312	2,039
Hot and Cold Piped Water	1,063	848	618	402	125
Cold water only	3,539	2,374	2,188	2,509	1,192
No piped water	105	128	167	401	722

Note: 1990 incl all units comprising occupied and vacant housing units

In 2005, most of the housing units with piped water were located in Koror State (Table 15.21). Included were virtually all the units with hot piped water. In contrast, the states of Ngchesar, Hatohobei and Sonsorol contained no housing units in 2000 with hot and cold piped water. Remaining states in the republic fell somewhere between the extremes of Koror State and the latter three. Most units usually possessed cold piped water but many had hot water as well.

Hot and cold water use is also an indicator of both wealth and energy use and conservation. Many households do not feel the need to have hot water in a hot, tropical climate. Those that do, to insure sterilizing, or for comfort, influence total energy consumption at the same time. And, costs – both financial and social – come into play.

Most housing units in Palau received water through the public utility system (often also supplemented by a catchments system) in 2005 (Table 15.22 and Figure 15.9). Alternative sources of water, both less modern and less reliable than a public system, declined over the same 25-year period to less than 5 percent of all the occupied units.

to ensure continued, constant supplies, or to reduce costs.

The vast majority of households receiving water from a public system in 2005 were in Koror and Airai states (Table 15.23). Even in the relatively modern setting of Koror State, many units had access both to the public water system and catchments, should the former fail for some reason. The same states that had little or no piped water — namely Hatohobei, Kayangel, and Sonsorol — also had little or no access to public water systems, as would be expected. Remaining rural states often had "Other" water sources, usually catchments systems, occasionally complemented by tanks.

Source of water is a measure of the government's ability to provide public services. In Palau's case, most of the population is able to receive water from a public system, even if they also supplement public water with catchments

The majority of units did not drink water from the public system, but rather relied on rainwater (Table 15.24). This use of rainwater was prevalent in all States. Some units in Koror, in particular, purchased bottled water, but bottled water was either unavailable or too expensive in the other States.

Palau's water remains relatively pure, unlike many other Pacific countries. A question of source of drinking water is used in many countries to ascertain the quality of the water systems. By this measure, Palau is doing very well. Most people get their drinking water either from the public system or from rainwater collected in catchments. About 15 percent buy bottled water as their primary source, and 5 percent or so buy bottled water, but also use rainwater as well. Hatothobei, Sonsorol, Kayangel, and Peleliu, and probably, Angaur, being separate islands, are not connected to public systems, so much get their water elsewhere.

Other source	555	717	849	1,844	1,821

Sources: 1995, 2000, &amp; v 2005, Tbl H06, OPS; 1990, Tbl 104 &amp; 1980, Tbl B5

Data on sewage disposal for housing units in Palau show that the percentage of units connected to the public sewer increased from 3 percent in 1980 to 30 percent in 1990 and on to more than half in 2000 and slightly less than half in 2005 (Table 15.25 and Figure 15.10). The numbers themselves also showed these great increases, with 66 units connected to public sewers in 1980 compared to 2,245 units in 2000. The number of units using a septic tank or cesspool, or some other means, increased considerably between 1980 and 1990, but less spectacularly between 1990 and 2000, before more than doubling between 2000 and 2005.

Figure 15.10. Percent Connected to Public Sewer, Palau and Koror: 2005

State-level data on sewage disposal in 2005 show that public sewer connections were in Koror State (Table 15.26) — making use of the sewage treatment plant there. [The small numbers for the other states are reporting errors.] Septic tanks and cesspools, modern alternatives to public systems, existed primarily in Koror and Airai states — with a few scattered elsewhere. However, with the exception of Koror, housing units in Palau tended to use other methods of sewage disposal. The widespread use of "other" disposal shows how far the government needs to go to reduce the health risks that often accompany less modern means of sewage disposal and treatment.

Sewage control is also an important public service, as well as ecological important. As noted, only about half of Palau's households are connected to a public sewer. Obviously, those households on separated islands cannot have sewers. However, sewers have not yet appeared in Airai yet either, so that only Koror has public sewage disposal. The small numbers appearing in the column for public sewer for the other states are reporting errors.

## Plumbing

Table 15.27. Occupied Housing Units by Plumbing Facilities: 1980 to 2005

Plumbing Facilities	2005	2000	1995	1990	1980
Total:	4,707	3,350	2,973	2,885	2,039
With complete plumbing	2,790	609	569	1,001	245
With hot & cold water	949	311	248	322	116
With cold water only	1,841	298	321	679	129
Lacking complete plumbing	1,917	2,741	2,404	1,884	1,794

Sources: 1995, 2000 &amp; 2005 Census, Tbl H05, OPS; 1990 Census, Tbl 103 &amp; 1980 Census, Tbl 10

The number of housing units in Palau with complete plumbing increased from about 12 percent to about 18 percent during the two decades (Table 15.27 and Figure 15.11). The number of residential units with hot and cold running water and the units with just cold running water both grew during the decades, the latter increasing at a much faster pace. Nevertheless, most housing units

in Palau still lacked U.S.-defined complete plumbing facilities in 2000. The figure for 2005 of 59 percent having complete plumbing showed a different definition of complete plumbing from previous censuses; the previous definition required hot and cold running water while the new definition accepted cold water only, because of lack of need for hot running water in Palau.

Figure 15.11. Percent with Complete Plumbing, Palau and Koror: 2005

In 2005 Koror State continued to contain most of the housing units in Palau with 70 percent having complete plumbing facilities (Table 15.28 and Figure 15.12). Koror also had 80 percent of the all units with hot water, down from 92 percent of the units with hot water in 2000. Airai State contained most of the remaining occupied residences with plumbing. Although most housing units in more rural states lacked complete plumbing in 2005, so did most units in Koror State.

Complete plumbing traditionally required connection to hot and cold piped water, a bathtub or shower, and a flush toilet, all of them in the building, and preferably the unit. For Palau, the definition was modified to include cold water only as well, since few people feel the need for hot water, and therefore feel their plumbing is complete with cold water.

Table 15.28. Occupied Units by Plumbing Facilities and State of Residence: 2005

Sources: 1995, 2000 &amp; 2005, Tbl H06, OPS; 1990, Tbl 103 &amp; 1980, Tbl 10

Note: Data for 1990 include all housing units comprising occupied &amp; vacant units

The number of housing units in Palau with flush toilets inside the unit increased dramatically after 1980 (Table 15.29). While about 14 percent of the units in 1980 had inside flush toilets, this value increased to 35 percent in 1990, 52 percent in 1995, 64 percent in 2000, and 68 percent in 2005 – that is, in 25 years the increase was from 1 in every 7 units to 2 of every 3.

As for the other characteristics, Koror State contained most of the modern toilets in the Republic of Palau in 2005, with most of the remainder located in Airai State (Table 15.30 and Figure 15.13). Koror State was the only state in the republic with more than half its housing units having a flush toilet. In contrast, a large proportion of the residential units located elsewhere in Palau had no flush toilet — including states generally associated with more traditional housing facilities, like Hatohobei and Sonsorol, as well as more developed states like Airai, Angaur, and Peleliu.

Source: 2005 Census, Table H06, OPS

As seen in Table 15.31, the percentage of units with a bathtub or shower increased phenomenally between 1980 and 1990 (from 15 percent of the units to 93 percent), stayed at about that level in 1995, then increased again to about 97 percent of the units in the 2000 Census, and more than 98 percent in 2005 (see Figure 15.14). Of all the changes in Palau's housing characteristics after 1980, one of the greatest increases occurred in the number of units with bathtubs or showers. The number of housing units lacking these bathing facilities decreased accordingly.

Figure 15.14. Percent w/Shower: 2005

Note: Data for 1990 include all housing units comprising occupied & vacant units

Only the most rural states in Palau generally lacked a complete inventory of modern bathing facilities in 2005 (Table 15.32). Although Koror State contained relatively few housing units that lacked this equipment, several other states had a greater percentage of units with a bathtub or shower. The trait distinguishing rural and urban housing units appears to be the location of bathing facilities. In contrast to most states in the republic where bathtubs and showers were located outside housing units, nearly half the Koror State units had these features located inside the residence.

Traditionally, an inside bathtub or shower was not considered a necessity, but as Palau has Westernized, the need for privacy has also become stronger as well. Only 72 of the 4,707 units did not have a bathtub or shower.

Table 15.32. Occupied Housing Units by Bathtub or Shower and State of Residence: 2005

## KITCHEN FACILITIES

The final type of residential equipment is kitchen facilities. One of the most important pieces of kitchen equipment is a refrigerator. Although the data on refrigerators are not strictly comparable over time, either in the housing unit types considered or in the data on refrigerators themselves, an increase in the percentage of housing with this item is apparent (Table 15.33). While about 54 percent of the units in 1980 had a refrigerator, this amount increased steadily over time, to 67 percent in 1990, 83 percent in 1995, 93 percent in 2000, and 92 percent in 2005.

Table 15.33. Occupied Housing Units by Refrigeration: 1980 to 2005

Refrigeration	2005	2000	1995	1990	1980
Total:	4,707	3,350	2,973	3,312	2,039

Note: 1990 incl all units comprising occupied & vacant units

Table 15.34 shows cooking facilities by type and by State for the 2005 Census. Most households used electricity for cooking, but about half the units used gas, either by itself, or in addition to electricity. Also, about 1/3<sup>rd</sup> of the units used kerosene, either by itself, or with electricity and/or gas. Still about 1 in every 10 households used biomass for some of their cooking.

Cooking fuel also is a measure of “wealth” in developing countries, since households must pay for electricity, gas, or kerosene. Also, traditionally, electricity or gas has been considered superior to kerosene, so the variable becomes an indicator of household well being. About 10 percent of the households still use biomass for at least some of their cooking; this use also has both cost and environmental implications. As would be expected, the closer to Koror, the more likely the use of electricity.

Table 15.34. Occupied Units by Fuel for Cooking and State of Residence: 2005

At least one vehicle	3,603	2,601	1,903	1,504	76.5	77.6	64.0	52.1
No vehicle	1,104	749	1,070	1,381	23.5	22.4	36.0	47.9

Source: U.S. Census for 1990; 1995, 2000 and 2005 Censuses, OPS

Finally, the Republic of Palau saw an explosion in the number of vehicles during the decade before the 2000 census (Table 15.35 and Figure 15.15). In 1990, about 48 percent – about half – of the housing units had no vehicle, but by 1995 this value decreased to about 1 in 3, and to less than 1 in 4 in the 2000 and 2005 censuses.

Figure 15.15. Percent Household w/No Vehicle, Palau and Koror: 2005

## Conclusions

The data on housing characteristics collected by the 2005 census of Palau were extensive, providing a remarkably detailed picture of the housing stock in the republic. Due to limitations of time and space, this chapter has focused on a small portion of these data — to show some aspects of housing of interest to planners and other government officials interested in development.

Most characteristics of the housing in Palau were dominated by the residential inventory in Koror State. In addition to containing most of the total housing units and occupied units, this state also contained the majority of modern innovations in Palau associated with housing — multiple unit structures, residential units with many total rooms and bedrooms, units constructed by new techniques and with more expensive materials, housing with the greatest access to public utilities and modern equipment, etc. Although the analysis of virtually every characteristic of housing in Palau inevitably begins by focusing on Koror, the characteristics of this state can be compared to the other states. In contrast to Koror State, the most rural, remote states of Hatothobei and Sonsorol feature housing stocks dominated by traditional construction and with few modern amenities.

## CHAPTER 16. COMPARISONS OF PALAUANS LIVING INSIDE AND OUTSIDE PALAU

The 1990 and 2000 censuses of Palau took place at the same time as censuses in Guam, the Commonwealth of the Northern Mariana Islands<sup>5</sup> (CNMI) and the U.S. — the three main destinations of emigrants from Palau at the time of the 1990 census, but Hawaii and the U.S. becoming much more important by 2000. The census reports for Guam and CNMI provide information on the Palau-born residents in each place, including age, marital status, fertility, citizenship, year of relocation, birthplace of parents, ethnic origin, residence 5 years before the census, language spoken at home, educational characteristics, labor force characteristics, occupation, and commuting characteristics.

The American administration of the TTPI encouraged, and in many ways the government of Palau continues to encourage, emigration for schooling and jobs. Higher education and improved training in selected skills have long been seen as the means of building strong foundations for future economic and political self-reliance. Many Palauans leave Palau, primarily in search of education or employment, and many of these individuals have yet to return to Palau. Some will not return. Emigration has reached levels affecting the population structure of those remaining in Palau.

This chapter examines data on Palau-born residing in Palau, Guam or the CNMI in 1990 and Palau in 2000 with Palau-born on Guam, CNMI, and Hawaii from the 2003 Censuses of Micronesian Migrants. These data will help to better understand both the reasons for emigration and the activities of Palau emigrants while living in these two places. So, the chapter provides useful complementary information to Chapter 8 — presenting data on the other half of the migration equation.

### Data Description

The topics discussed in this chapter already have received attention in this monograph, in the various chapters that dealt with similar topics for Palau itself. Rather than repeat a series of definitions, and comments on limitations and comparability with previous censuses, readers should refer to the appropriate chapter for the topics.

### Analysis of Data on Palau-born Inside and Outside Palau

Of the 15,122 persons in Palau in 1990, 12,321 (81.5 percent) were born in Palau, an amount that decreased to 12,819 of 19,129 (67.0 percent) in 2000 (Table 16.1). The absolute number of Palau-born in Palau, though, increased by about 500 during the decade, or about 50 per year. Since Palau has about 350 births and 150 deaths each year, net out migration are about 150 per year. These figures are seen, to a certain, small extent in the numbers migrating to Guam, CNMI, and Hawaii discussed

Sources: 1990 & 2000 Census of Palau, 2003 Census of Micronesian Migrants

Note: Total for 2000 possibly double-counting as Census of Micronesians was done 3 years after the 2000 Census of Palau

here, but, as with the Federated States of Micronesia and the Marshall Islands, the larger trend is to the United States mainland for both education and jobs.

The 1990 Census for Guam counted 1,233 Palau-born and the CNMI census counted 1,407. Unfortunately, as of this writing, data are not yet available on characteristics from the 2000 Censuses for Palau-born in Guam, CNMI, or the United States. However, in 2003, the Office of Insular Affairs, Department of the Interior, funded surveys of Freely Associated States migrants to Guam, CNMI, and Hawaii. We show results from those surveys here. And, because we

<sup>5</sup> For this chapter, we use the term "the Marianas" for Guam and the Commonwealth of the Northern Mariana Islands together.

expect little change between 2000 and 2003, we will use the dates interchangeably in this short analysis. Hence, the total numbers in Guam were 1,201, CNMI were 1,507 and 266 were in Hawaii.

The median age in 1990 for all Palau-born was about 25.3 years – slightly lower than for any of the groups, but this is explained by the method of determining the median, using 5-year age groups. Once again, the median age is that age which divides the population exactly in half – half being older and half being younger. The median age for Palau and CNMI in 1990 was 27.9, while the median age for Guam's Palau-born was slightly higher, at 33.1. The median increased to 27.4 years in 2000, showing reduced fertility of Palau-born, and longer life expectancy. The median for Palau-born in Palau increased 4 ½ years, from 23.5 to 28.1 years, while median for Guam decreased by about 8 years, and the median for CNMI decreased during the 13 years, from 27.9 to 20.0 years. The median age for Hawaii's Palau-born was 25.5 in 2003, about the same as for Guam.

The age composition of the Palau-born populations in the three places in 1990 and four places in 2000/2003 differed considerably, as expected when comparing the resident population of Palau with the migrant populations of Guam and the CNMI. These differences are seen both in the relative size of each age group and in median ages. For 1990, for example, the largest percentages of Palau-born residents in Palau were in the age groups under 20 years old, with each of the five-year groups containing at least 11 percent of the population and together comprising more than 45 percent of the total. In contrast, the ages most heavily represented among Palau-born migrants to Guam or the CNMI were between 15 and 29 years, with the largest group aged 20-24 years. Young adults were more prevalent among the migrants while even younger persons were more prevalent among Palau-born in Palau. Because very few old people migrate, more older Palau-born people lived in Palau than outside Palau — yielding similar median ages for Palau and the two main migrant destinations.

Table 16.2. Palau-born Males by Age Group: Palau, Guam, CNMI and Hawaii: 1990 and 2000/3

Table 16.2 shows the same table for males. In 1990, about 6,300 males residing in Palau were born in Palau, while 1,200 male residents of Guam and CNMI were born in Palau. The age distribution of Palau-born males was similar to that noted for all Palau-born — that is, proportionally more young males resided in Palau while the Palau-born males of Guam and the CNMI were more likely to be young adults. The Palau-born male population in these three areas was younger than the total Palau-born population. Males had similar median ages for the three areas — 22.6 years for the entire Palau-born male population, 23.0 for Palau-born males residing in Palau, and 26.9 for males living in the Marianas.

Note: Total for 2000 possibly double-counting as Census of Micro was done 3 years after the 2000 Census of Palau

The 1990 and 2000 censuses showed similar trends for females with the female ages slightly higher than the males because females have longer life expectancy (Table 16.3). The median age for Palau-born females increased by about 2 ½ years between 1990 and 2000, from about 26.1 to 28.7 years. The median age for Palau-born females in Palau increased even more, by about 5 years, from 24.1 to 29.6. The median age for Palau-born females on Guam also decreased by 5 ½ years, and CNMI's median age decreased by 3 years, mostly because of the large number of girls 5 to 14 years old, perhaps girls who are staying with sponsors while going to school. The median age for Palau-born females in Hawaii was 25.4, about the same as for the males.

The sex ratio is the percentage of males in the populations, usually presented as males per 100 females. So, in Table 16.4, the figure of 101 for 1990 means that in the four Areas, 101 males were present for each 100 females.

The places shown had slightly more Palau-born males than females in both 1990 and 2000. But male-female ratios differed considerably between those residing in Palau and those living on Guam or in the CNMI, the latter two containing only about 9 males for every 10 females. Hawaii had 106 males for every 100 females in 2003. In 1990, Palau's Palau-born showed a predominance of males in the early ages, and females in the older ages, as would be expected in a non-migrating population experiencing normal mortality. Guam's Palau-born males predominated in the 0 to 9 ages, and by a fluke, in the 55 to 59 year age group, while a shift upward of 5 years occurred in CNMI. In 2000, the Palau distribution was similar to that of 1990, while Guam had become more male, particularly in the young adult ages. CNMI's total changed little although its distribution did change somewhat, and the small number of total Palau-born in Hawaii showed considerable variation over the ages.

Table 16.4. Palau-born Males per 100 Females by Age Group: Palau, Guam, CNMI &amp; Hawaii: 1990 &amp; 2000/3

Age Group	Total 1990	Palau 1990	Guam 1990	CNMI 1990	Total 2000/3	Palau 2000	Guam 2003	CNMI 2003	Hawaii 2003

Note: Total for 2000 possibly double-counting as Census of Micro was done 3 years after the 2000 Census of Palau

**Language:** While less than 2 percent of all Palau-born residents of Palau, Guam, and the CNMI spoke English at home in 1990, this figure increased to 12 percent in 2000 (Table 16.5). However, language use differed based on place of residence: less than 1 percent of the Palau-born in Palau spoke English at home in 1990 compared to 9 percent in 2000.

Table 16.5. English Speaking Palau-born at Home: Palau, Guam, CNMI and Hawaii: 1990 and 2000/3

English Speaking Palau-born at home	Total 1990	Palau 1990	Guam 1990	CNMI 1990	Total 2000/3	Palau 2000	Guam 2003	CNMI 2003	Hawaii 2003

Note: Total for 2000 possibly double-counting as Census of Micro was done 3 years after the 2000 Census of Palau

The percentage of English speakers increased from 12 percent to 30 percent on Guam, and 2 percent to 32 percent in the CNMI (the 2003 survey was taken on Saipan only). Although Hawaii was not included in early surveys, 30 percent of the Palau-born living there spoke English at home. The larger percentage for Palau-born on Guam in 1990 who spoke English at home suggests both that Palauans have been moving to Guam over a longer period of time than to the CNMI, and that these migrants have integrated more fully into the English-speaking community. Since good jobs and education on Guam clearly are related to English use, these figures were not surprising. All places saw increased use of English, with CNMI's use passing Guam in 2000, indicating the importance of English in government and private sector work, and in daily activities.

**Education:** The data in Table 16.6 show educational attainment of Palau-born persons aged 25 years and over in terms of cumulative percentages. For example, in 1990 the 54 percent of all Palauans who were high school graduates (or equivalent) means that 54 percent had at least a high school diploma — including the 1 percent with graduate or professional degrees, the 8 percent with Bachelor's degrees, and so on. Of all the Palauans considered in this analysis, more than 32 percent had fewer than 8 years of formal education and about 27 percent had some post high school education.

Note: Total for 2000 possibly double-counting as Census of Micro was done 3 years after the 2000 Census of Palau

In 1990, slightly more than half the Palau-born in Palau had at least a high school diploma, compared to nearly 2 out of 3 of all Palauans residing on Guam or in the CNMI. The Palau-born population of the Marianas had larger proportions of persons with some college background (but no degree) and graduate or professional degrees. Palau, in contrast, contained proportionally more individuals with associate and Bachelor's degrees. Palau-born individuals residing in the CNMI in 1990 had a distribution very similar to that seen for Palau-born in Palau for those with some college or more education. As noted, however, while 2/3rds of the Palau-born adults in CNMI had high school diplomas, this was true for only half of those born in Palau. Palau contained larger percentages of Palauans aged 25 years or more with fewer than 8 years of formal schooling. Once again, educated migrants (including Palauans) are more likely to migrate, although it is impossible to determine with the data available whether this education was obtained before or after they left Palau.

By the time of the 2000 census, the percentage of high school graduates for all Palau-born in these four places was 65 percent, an increase of 11 percentage points during the decade (discounting the influence of adding Hawaii in 2000.) The percentage being high school graduates increased from 50 to 63 percent for those in Palau, 64 to 68 percent for Guam, 67 to 73 percent for CNMI, and 85 percent of the Palau-born 25 years and older and living in Hawaii in 2000 were high school graduates.

Palau-born with Bachelor's degrees did show as much increase. The percentage for all Palau-born in these places increased only from 7.9 percent in 1990 to 9.3 percent in 2000. The percentage with Bachelor's degrees in Palau increased from 8 percent to 10 percent, Guam increased slightly, CNMI decreased slightly, and 16 percent of the Palau-born in Hawaii had Bachelor's degrees, showing out-migration of highly educated Palauans.

The percentage of Palau-born males 25 years and over with high school diplomas increased from 58 percent in 1990 to 62 percent in 2000 (Table 16.7). As with the total population, Palau-born in Palau had lower educational attainment than those living outside. In 2000, while about 6 in every 10 Palau-born males in Palau were high school graduates, about 7 in every 10 of those on Guam and in the CNMI fell in this category, as did 9 of 10 of those in Hawaii. The percentage of college graduates changed very little for Palau-born in Palau, CNMI or Guam. However, about 1 in every 5 Palau-born in Hawaii was a college graduate, about twice the proportion for Palau and Guam, 3 times the proportion in CNMI.

Note: Total for 2000 possibly double-counting as Census of Micro was done 3 years after the 2000 Census of Palau

Hawaii, the percentage was 79 percent in 2000. The percentage of Palau-born female college graduates increased during the decade for Palau, from 7.6 percent to 9.5 percent, and Guam, from 5.6 to 6.5 percent. The figures for CNMI decreased slightly, from 8.4 percent in 1990 to 7.9 percent in 2003. And, 12 percent of the Palau-born females in Hawaii were college graduates.

### Labor Force Participation

One of the main reasons given for migration from Palau to Guam and the CNMI is to look for jobs. The remainder of this chapter explores employment characteristics of Palauans residing in Palau and the Marianas.

#### Labor force participation.

Slightly more than 55 percent of all Palau-born persons living in Palau or the Marianas and aged 16 years or older were in the labor force the week before the 1990 census (Table 16.9). This value was 54 percent in 2000, showing little change over the decade. As noted in Chapter 11, though, labor force participation rates are very susceptible to short-term economic trends, so not too much should be read into these figures.

Table 16.9. Palau-born 16 years &amp; over by Labor Force Participation: Palau, Guam, CNMI &amp; Hawaii: 1990 &amp; 2000/3

Note: Total for 2000 possibly double-counting as Census of Micro was done 3 years after the 2000 Census of Palau

About 53 percent of the Palau-born population in Palau in both 1990 and 2000 were in the labor force, and the percentage for Guam was 58 percent in both 1990 and 2003. For CNMI, however, the percentage decreased from 71 percent in 1990 to 63 percent in 2003 – part of the decrease was probably the result of the smaller numbers of people in the labor force. For Hawaii, the labor force participation rate was 60 percent in 2003.

In both censuses and in all places, male labor force participation was higher than the comparable female rate. Male labor force participation decreased from 64.4 percent in 1990 to 61.6 percent in 2000, a drop of almost 3 percentage points. Female labor force participation remained constant at less than 47 percent. The male rate for Palau and CNMI decreased slightly for the two points in time, while it held steady for Guam. The female rate for Palau and Guam increased, while the rate for CNMI decreased by 14 percentage points – it is likely that females in CNMI were either working in the garment factories in 1990 and not in 2003, or were working in subsidiary enterprises in 1990. The male rate for Hawaii in 2003 was about 6 percentages higher than for females.

Sources: 1990 Censuses, 2000 Census of Palau, 2003 Census of Micronesian Migrants

Note: Total for 2000 possibly double-counting as Census of Micro was done 3 years after the 2000 Census of Palau

**Occupation:** As noted earlier, the number of employed Palau-born people in Palau, Guam, and CNMI (and Hawaii in the later set) more than doubled, from 5,081 in 1990 to 10,378 in 2000 (Table 16.10). However, most of the increase was in Palau itself,

since Guam and CNMI both saw losses in the employed population during the decade as Palau-born moved elsewhere. The 135 Palau-born in Hawaii also represents a decrease from Palau-born residents in earlier years.

The largest category of workers in 1990 was technical, sales, and administrative support workers, although the percentage decreased from 29 percent in 1990 to 23 percent in 2000. The percentage of people in managerial and professional specialty occupations was second in 1990, at 25 percent, but decreased to 23 percent in 2000, where it was first. Service occupations were third in both years, remaining at 19 percent. The next two categories exchanged places between 1990 and 2000 – operators, fabricators and laborers were 14 percent of the employed in 1990 but 12 percent in 2000, while precision production, crafts, and repair personnel increased from 9 percent in 1990 to 16 percent in 2000. The percentage of people doing farming, forestry, and fishing increased from 3 percent in 1990 to 7 percent in 2000, mostly because of the large numbers of these workers in Palau itself by 2000.

The percentages seen for all Palau-born were mirrored in the percentages for Palau-born in Palau, mostly because most of the Palau-born were still in Palau. The percentages for Guam also showed some shifts – a larger percentage of people being operators, fabricators, and laborers, and smaller percentages of “technical, sales, and administrative support” personnel, and service workers. And the CNMI saw a large decrease – from 20 to 13 percent – of service workers, while having a large increase in operators, fabricators, and laborers – from 19 to 24 percent. The largest numbers of Hawaii’s employed were in technical, sales and administrative support, service, and precision production, crafts and repairs.

*Class of Worker.* In 1990 slightly more than half of all employed Palau-born in Palau, Guam, and the CNMI worked in the private sector for wages and salary compared to about 7 in 10 in 2000 (Table 16.11). About 44 percent of the workers were in the government in 1990 compared to about 29 percent in 2000. The decade also saw a large drop in the percentages that were “other” workers – self-employed and unpaid family workers.

Table 16.11. Palau-born Employed 16 years & over by Class of Worker: Palau, Guam, CNMI & Hawaii: 1990 & 2000/3

Class of Worker	Total 1990	Palau 1990	Guam 1990	CNMI 1990	Total 2000/3	Palau 2000	Guam 2003	CNMI 2003	Hawaii 2003

Note: Total for 2000 possibly double-counting as Census of Micro was done 3 years after the 2000 Census of Palau

In 1990, more than half of Palau’s Palau-born workers were in the government, but by 2000, only about 3 in 10 of the workers were in the government. In the other Areas, however, the vast majority of workers were in the private sector – more than 3 in 4 of the 1990 Guam and CNMI workers, and as may as 87 percent of Guam’s 2003 workers, along with 72 percent of the CNMI Palau-born workers. Hawaii had very few workers, but of those, about 4 in 10 were Government workers. The signs for a better division between private and government employment in Palau are promising, as the private sector clearly strengthened over the decade.

## Conclusions

This chapter has compared demographic, social, and employment characteristics of Palau-born persons residing in Palau, on Guam, in the CNMI and in Hawaii. The comparisons made in this chapter have contrasted two fundamentally different groups of people — the resident Palauan population in the Republic of Palau with the migrant Palauan populations in the Marianas and Hawaii. Many differences came from migrant Palauans having moved for jobs and education.

The data presented here confirm that the majority of Palauans residing on Guam, the CNMI, and Hawaii were attending school or employed in wage labor. Many of these migrants have obtained, or are obtaining, valuable skills that could serve Palau well should they choose to return. In the case of employment, the original reason for emigration also becomes the main reason for not returning to Palau — more jobs exist in the Marianas, Hawaii, and the U.S. mainland than in Palau. As long as places outside Palau offer higher paying jobs, many of the Palauans who already have migrated likely will remain, and other Palauans quite probably will follow. The only obvious means to stem the flow of Palau-born migrants, and possibly begin return migration to Palau, is through reducing the differences in the job markets of Palau and the outside world.

## CHAPTER 17. COMPARISONS WITH THE UNITED STATES AND ITS TERRITORIES

This monograph presented historical data and data leading to and including the 2000 Census of the Republic of Palau to show past and current demographic, social, economic, and housing conditions in Palau. We have tried to present information in a way that is both easily understood and easily used by planners and policy makers. While the focus of the monograph was on Palau, we want to take the opportunity in this chapter to look at how Palau compares with the other territories and with the United States. We will look at population characteristics from the 1980, 1990 and 2000 Censuses of Population and Housing for the United States, Guam, American Samoa, the Commonwealth of the Northern Mariana Islands (CNMI), and the Republic of Palau. Data on housing characteristics for the United States and its territories will be presented in a separate paper.

For the 2000 censuses, the Census Bureau worked with the governments of Guam, American Samoa, and the Northern Mariana Islands to develop items that were as close as possible to the U.S. items, but also permitted satisfying local needs. In most cases, the questionnaire items were identical. The Republic of Palau decided, in 1999, to have a concurrent census with the United States and the United States Insular Areas to obtain comparable data for planning.

Monographs based on the 2000 census are planned for the Pacific Islands areas to look at historical trends for the population and housing items. The governments of Guam (Barcinas, Levin, and Naval 1988), and American Samoa (Filiga and Levin 1988) published 1980 census volumes. The CNMI also developed a 1980 census volume (Borja and Levin, ms) but did not publish it. The present 2000 Census volume for Palau follows the monographs prepared by the Federated States of Micronesia for its 2000 Census, and so is the second in the series for the 2000 censuses.

### DEMOGRAPHIC CHARACTERISTICS

**Median Age.** The median age in the United States in 2000 — that age halving the population into younger and older parts — was 35.3 years, an increase of about 2 ½ years from the 32.9 years in 1990 (Table 17.1). The median age in 2000 for the United States was about 5 years older than for Palau, the oldest of the Pacific Islands areas. CNMI followed at 28.7 years, Guam at 27.4, and American Samoa had the youngest population, at 21.3 years, fully 14 years younger than the median for the United States. Between 1980 and 2000, the median age for United States increased about 5 years, as it did for Guam, and only 2 ½ years for American Samoa. But because of immigration, the CNMI saw its median age increase by 9 years, while Palau's increase was even more, from 18.8 years to 30.8 years — going from ties with American Samoa as the youngest of the group, to being alone as the oldest median age.

Table 17.1. Median Age by Area: 1980 to 2000

Year	Palau	Guam	Northern Mariana Is.	American Samoa	United States
2000	30.8	27.4	28.7	21.3	35.3
1990	25.6	25.0	27.4	20.9	32.9
1980	18.8	22.2	19.6	18.8	30.0

Source: Decennial Censuses

The difference in the age distributions are represented by looking at one group — those aged less than 5 (Table 17.2). While about 7 percent of the total U.S. population and Palau was less than 5 years old, about 8 percent of CNMI's population was in this category, 11 percent of Guam's, and almost 14 percent of American Samoa's population. All of the Areas saw decreases in this age group, showing a general aging of their populations. The smaller this age group, the fewer classrooms and clinics will be needed in the near future.

Table 17.2. Percentage of Population Less than 5 years: 1980 to 2000

Year	Palau	Guam	Northern Mariana Is.	American Samoa	United States
2000	6.8	10.8	8.4	13.6	6.8
1990	10.0	11.3	9.5	14.9	7.4
1980	11.6	12.3	14.7	14.8	7.2

Source: Decennial Censuses

**Males per 100 Females.** Most human populations have more females than males because male mortality is higher. The common demographic measure is the number of males per 100 females. Hence, the number of males per 100 females in the United States increased only slightly between 1980 and 2000 — from 94.5 to 96.3 (partly because of increased female mortality) (Table 17.3).

Table 17.3. Males per 100 Females: 1980 to 2000

Year	Palau	Guam	Northern Mariana Is.	American Samoa	United States
2000	120.4	104.7	85.9	104.4	96.3
1990	116.6	114.0	111.0	105.6	95.1
1980	107.6	109.2	110.7	103.0	94.5

Source: Decennial Censuses

Each of the Pacific Islands areas, except the CNMI, had more males than females. Because of the garment factories in the CNMI, its population went from a surplus of males (construction in the 1980s and early 1990s influenced having immigrant males in the population) to a surplus of females in 2000, with the garment industry still fully operational.

While the number of males per 100 females in the CNMI stayed at about 111 between 1980 and 1990, it dipped to 86 in 2000. The number of males per 100 females increased from 103 to 104 in American Samoa between 1980 and 2000, Guam increased from 109 to 114 then decreased to 105, and Palau increased from 108 to 117 between 1980 and 1990, and then to 120 in 2000. Although increased female mortality may be contributing a small amount to this change, most of the change is due to selective immigration of males to these areas, particularly to Palau.

Table 17.4. Persons per Household: 1980 to 2000

Year	Palau	Guam	Northern Mariana Is.	American Samoa	United States
2000	4.6	3.9	3.7	6.1	2.6
1990	5.0	4.0	4.6	7.0	2.6
1980	5.8	4.1	5.4	7.1	2.8

Source: Decennial Censuses

**Persons per Household.** The average number of persons per household decreased in the United States and all of the Pacific Islands areas between 1980 and 2000. The decrease in the United States was from 2.75 persons per household in 1980 to 2.59 in 2000 (Table 17.4). None of the Pacific areas, of course,

had this small number of persons per household. Guam, the closest to the United States economically, was also closest demographically, in this case about 4 persons per household, down slightly from 1980 to 1990 to 2000. The number of persons per household in American Samoa remained very high, at 6 persons per household, showing continued housing of extended families, even with a decline of one person between 1990 and 2000. Palau's households decreased by 1 1/2 people during the 20 years, while the CNMI decrease was even greater, to 3.7 per household, even lower than Guam's level.

**Family Type.** About 75.9 percent of all families in the United States in 2000 were married-couple families, that is, at least a husband and wife, whether or not children were present as well. In 1980, 83 percent of the U.S. families were in this category (Table 17.5). The percentage of married-couple families also decreased in every one of the Insular Areas shown over the 20-year period. Between 1980 and 1990, Guam and the Northern Marianas showed declines in approximately the same percentage as for the U.S., while Palau and American Samoa remained relatively constant. However, while the U.S. experienced a further decrease of 3 percentage points between 1990 and 2000, American Samoa's decline was 11 percentage points, Palau's was 12, Guam's was 20, and CNMI's was a rather drastic 30 percentage point decrease during the decade.

Table 17.5. Percent of Married-Couple Families: 1980 to 2000

Year	Palau	Guam	Northern Mariana Is.	American Samoa	United States
2000	63.2	58.5	68.5	70.6	75.9
1990	75.5	78.1	74.3	81.8	78.6
1980	75.4	84.8	79.7	81.1	82.8

Source: Decennial Censuses

The percentage of U.S. families with a female householder having no husband present increased between 1980 and 1990, from 14.0 percent of the families in 1980 to 16.5 percent in 1990, but then to 17.9 percent in 2000 (Table 17.6). More than 18 percent of Palau's families were in this category in 2000, compared to 16 percent for Guam, 15 percent for American Samoa, and 12 percent of the families in the CNMI.

Table 17.6. Percent of Families with Female Householder: 1980 to 2000

Year	Palau	Guam	Northern Mariana Is.	American Samoa	United States
2000	18.1	16.2	11.8	15.0	17.9
1990	18.1	14.0	14.0	12.2	16.5
1980	17.6	11.1	12.1	12.7	13.9

Source: Decennial Censuses

## SOCIAL CHARACTERISTICS

**Birthplace.** The percentage of persons born and living in the United States decreased somewhat between 1980 and 2000, from 94 percent in 1980 to 92 percent and 89 percent in 2000 (Table 17.7). Hence, in 2000, about 11 percent of the U.S. population was born outside the United States.

Table 17.7. Percent Born in Area of Residence: 1980 to 2000

Year	Palau	Guam	Northern Mariana Is.	American Samoa	United States
2000	67.0	52.2	35.9	56.7	88.9
1990	81.5	47.7	38.6	54.7	92.1
1980	96.0	49.2	71.5	57.5	93.8

Source: Decennial Censuses

Palau remained the Area with the largest percentage of native born, but this percentage decreased sharply during the two decades. While 96 percent of the people living in Palau in 1980 were born here – a percentage even higher than the United States – by 2000 only 67 percent were born in Palau. The decline was continuous during the two decades, as shown by the 82 percent being native born in 1990.

The percentages for American Samoa and Guam were intermediary – in both cases, the percentage native born decreased between 1980 and 1990, before increasing between 1990 and 2000. It is likely that these increases had to do with harder economic times, so less immigration took place.

But, CNMI experienced by far the biggest decrease in percentage born in CNMI. While 72 percent of the Commonwealth's population was born in the Commonwealth in 1980, this percentage decreased to 39 percent in 1990, and then to only 36 percent in 2000, attributable to the extremely large influx of foreign workers.

#### Residence 5 Years Before the Census

Residence 5 years before the census shows short-term migration, contrasted to data on birthplace, giving long-term migration. More than half of the United States population 5 years and over in 1990 — 53 percent — had lived in the same house in 1985 as 1990, about the same as those living in the same house in 1995 and 2000. Similarly, the percentages for U.S. residents in 2000 living outside the U.S. in 1995 was only one percentage point higher than the 2 percent who lived outside the United States in 1985 but inside in 1990 (Table 17.8).

Table 17.8. Percent Persons 5 years & over Living in Same House or Outside: 1990 & 2000

Year	Palau	Guam	Northern Mariana Is.	American Samoa	United States
2000					
Same House	63.4	53.0	37.8	75.0	54.1
Outside	26.8	17.4	37.6	13.4	2.9
1990					
Same House	65.9	56.3	29.3	77.2	53.3
Outside	16.8	32.7	53.2	15.8	2.2

Source: Decennial Censuses

The Pacific Islands areas showed considerable variation for this item. For Guam, with its large military and migrant populations, the percentage living in the same house was somewhat less than for the U.S., but about 1/3rd of all the persons over 5 living on Guam in 1990 actually lived outside Guam in 1985. The rest — about 21 percent — lived in another house on Guam in 1985. By 2000, the percentage living in the same house on Guam decreased somewhat to 53 percent, but the percentage living outside Guam 5 years before decreased by 15 percentage points, showing less military movements, less movement of Freely-associated persons to Guam, and fewer immigrants from Asia and elsewhere.

The CNMI, showed a similar phenomenon, but with much higher percentages. Fully 53 percent of CNMI's 1990 population lived outside CNMI in 1985, but had moved to CNMI by 1990, meaning that more than half of CNMI's resident population in 1990 had moved there within the 5 years before the census, pretty astounding even given the special case of CNMI and its open-armed attitude toward the immigrants. By 2000, the percentage of those outside had decreased to 38 percent, still a very large percentage. At the same time, by 2000, many of the immigrants had settled permanently in the CNMI, so that the percentage in the same house increased from less than 3 in every 10 persons who lived in the same house in 1985 as 1990 to almost 4 in 10 in 2000.

American Samoa was a different case. More than 3/4ths of American Samoa's population lived in the same house in 1985 as 1990 and 1995 as 2000, but only 16 percent lived outside American Samoa in 1985 but inside in 1990 decreasing to 13 percent in 2000.

Palau's population showed a different situation from all the others. While, like American Samoa, it showed a modest decline in the percentage living in the same house in 1985 as 1990 and 1995 as 2000, the percentage living outside Palau 5 years before the census showed a big jump, from 17 percent in the 1990 census to 27 percent in the 2000 census. These migration patterns mirror those of the CNMI during its big in-rush of migrants.

Speak a Language Other Than English at Home The percentage of persons 5 years old and over in the United States who spoke a language other than English at home in 2000 was 18 percent, up from 11 percent in 1980, and 14 percent due to increased immigration during the decades (Table 17.9).

Table 17.9. Persons 5 years & over Speaking non-English at home (%): 1980 to 2000

Year	Palau	Guam	Northern Mariana Is.	American Samoa	United States
2000	90.6	61.7	89.2	97.1	17.9
1990	97.0	62.7	95.2	97.0	13.8
1980	99.0	64.3	95.0	96.1	11.0

Source: Decennial Censuses

Guam had the lowest percentages speaking a language other than English in all the three census years, the percentage decreasing from 64 to 62 percent during the two decades. American Samoa remained the most homogeneous, with 97 percent not speaking English — presumably speaking Samoan. The CNMI saw an increase in English speakers, from about 5 percent in 1980 and 1990 to 11 percent in 2000. And Palau's increase was even greater, from only one percent speaking English in 1980 and 3 percent in 1990 to 9 percent in 2000.

**Educational Attainment**. About 4 in every 5 people 25 years old and over in 2000 were high school graduates, up from 3 in every 4 in the United States in 1990 and 2 in every 3 in 1980 (Table 17.10). The percentages for Guam were slightly lower in each census year.

The other areas had much lower high school graduation rates in the 1980 and 1990 censuses, but each experienced large increases over the decade. The CNMI went from 45 percent high school graduates to 69 percent during the two decades, and American Samoa increased from 42 percent in 1980 to 66 percent in 1990, an increase of 24 percentage points. But Palau had the biggest increase, from 34 percent in 1980 to 74 percent in 1990, and increase of 40 percentage points, with almost 3 in every 4 people 25 years and over being high school graduates.

Table 17.10. Persons 25 years &amp; over being High School graduates (%): 1980 to 2000

Year	Palau	Guam	Northern Mariana Is.	American Samoa	United States
2000	74.1	76.3	69.2	66.1	80.4
1990	57.6	73.3	66.3	54.5	75.2
1980	33.9	65.6	44.7	42.1	66.5

Source: Decennial Censuses

Table 17.11. Percent 25 years &amp; over being College graduates: 1980 to 2000

Year	Palau	Guam	Northern Mariana Is.	American Samoa	United States
2000	10.0	20.0	15.5	7.4	24.4
1990	10.3	17.5	15.6	6.9	20.3
1980	5.4	17.5	11.3	7.6	16.2

Source: Decennial Censuses

The percent of college graduates aged 25 years and over in the United States increased from 16 percent to 24 percent during the two decades, going from about 1 in 6 to 1 in 4 (Table 17.11). (The 1980 data were collected in terms of number of years in

school, making them not completely comparable with the 1990 and 2000 data that collected highest degree obtained.) The percent of college graduates on Guam did not change between 1980 and 1990, but jumped to 1 in every 5 people 25 years and over in 2000. However, the college graduates increased from 11 percent to 16 percent of CNMI's adult population between 1980 and 1990, and then remained at that level in 2000. And, Palau's increase between 1980 and 1990 was from 5 to 10 percent in Palau, where it remained in 2000. The percentage of college graduates in American Samoa remained at about 7 percent throughout the period. (Because of the continuing influx migrants in the various Areas, it is possible that the rate of college graduates could go down without the number decreasing.)

## ECONOMIC CHARACTERISTICS

**Labor Force Participation**. Labor force participation depends on the current economic situation at the time of the census. However, even with these snapshots, we can see some general trends. The overall labor force participation of persons 16 years and over during the week before the census in the U.S. in 2000 was 64 percent, down from 65 percent, but up from 62 percent in 1980 (Table 17.12). All of the Pacific Islands areas also experienced increases in labor force participation rates during the decade of the 1980s. Except for Guam, all the Areas saw increases between 1990 and 2000 as well.

Table 17.12. Percent 16 years &amp; over in the Labor Force: 1980 to 2000

Year	Palau	Guam	Northern Mariana Is.	American Samoa	United States
2000	67.5	61.4	84.1	52.0	63.9
1990	59.3	72.7	81.8	50.7	65.3
1980	41.6	66.6	63.6	45.5	62.0

Source: Decennial Censuses

The labor force participation on Guam increased from 67 percent to 73 percent during the decade, higher than the rate for the U.S. because of the large number of alien workers in construction, tourism, and related activities, and, perhaps because of the presence of the

military. Then, again because of economic conditions, Guam showed a great decrease, to 61 percent, lower than all Areas except American Samoa. This great decrease could be attributed to fluctuations in the numbers of military personnel, migration of Freely-Associated States personnel and foreign workers, and Asian economic troubles at the time of the census.

The CNMI experienced by far the largest increase in the 1980s — from 64 percent in 1980 to 82 percent in 1990 — partially because of the emerging private sector, and this trend continued to 84 percent of adults in the labor force in 2000. With virtually full employment, almost anyone wanting a job would be able to have one. The very large immigrant population was almost completely in employment, since most could not stay in the CNMI without employment.

American Samoa showed the smallest increase in labor force participation — even in 2000, only slightly more than half of the adults were in the labor force. While United Nations and other agencies consider subsistence workers as part of the labor force, the United States does not, and, therefore the rate is lower than it would be if all “economically active” people were included. On the other hand, many of the people doing subsistence activities would have done paid labor, if it had been available.

Palau is the great success story of the Areas shown here. The percentage in the work force increased from just 2 in every 5 adults in 1980 to 2 in 3 in 2000. Of course, many of the workers were foreign workers, particularly in the private sector.

The labor force participation of males in the United States decreased during the two decades, while female labor force participation increased considerably between 1980 and 1990, and continued upward in 2000. This improvement in female labor force participation was seen in all of the territories (except Guam) as well — with American Samoa increasing by 8 percentage points, Palau by 28, and CNMI by 34 points (Table 17.13). Guam females increased by about 10 percentage points between 1980 and 1990, before declining about 2 points between 1990 and 2000. While about half of the CNMI adult females were in the labor force in 1980, about 3 in 4 were in 1990, and more than 4 of every 5 in 2000.

Table 17.13. Percent 16 years &amp; over in the Labor Force by Sex: 1980 to 2000

Year	Palau	Guam	Northern Mariana Is.	American Samoa	United States
<b>Males</b>					
2000	74.9	73.1	86.6	60.0	67.8
1990	68.3	83.8	87.4	58.8	74.4
1980	52.6	82.2	77.1	55.6	75.1
<b>Females</b>					
2000	58.1	57.8	82.1	43.8	57.5
1990	48.4	59.5	75.3	42.4	56.8
1980	29.7	49.2	47.6	35.5	49.9

Source: Decennial Censuses

The percentage of CNMI males in the labor force was even greater — almost 7 out of every 8 adult males was in the labor force (compared to 2 of 3 in the U.S.) in 2000. Much of this elevated employment has to do with the very large number of immigrants who must be working to legally remain in the CNMI. Guam's male labor force rate was also very high, but decreased by 10 percentage points between 1990 and 2000, placing it below Palau's rate for males. The rate for American Samoa males continued to increase throughout the two decades.

**Class of Worker** . The percentage of private sector workers in the United States increased slightly between 1980 and 1990, from less than 76 percent to more than 77 percent, and continued to increase in the 2000 Census (Table 17.14). The only Pacific area with a larger percentage in the private sector in 2000 was the CNMI at 87 percent, up from 56 percent in 1980 to 85 percent in 1990.

Table 17.14. Employed 16+ years Private Wage &amp; Salary Workers (%): 1980 to 2000

Year	Palau	Guam	Northern Mariana Is.	American Samoa	United States
2000	69.3	69.0	87.2	67.9	78.5
1990	59.3	65.3	84.8	63.4	77.4
1980	37.0	50.7	55.7	46.0	75.6

Source: Decennial Censuses

Palau also experienced an enormous increase, from 37 percent to 59 percent between 1980 and 1990, and another percentage points, to 69 percent in 2000. Hence, while almost 4 in every 10 workers in 1980 worked in the private sector in 1980, the reverse was true in 1990; almost 4 in every 10 did not work for the private sector in 1990, and only 3 in 10 in 2000. The percentage of private sector employment on Guam increased from 51 percent to 69 percent during the two decades.

**Household Income** . The median household income in the United States in 1989 based on the 1990 census was \$30,000, and was \$42,000 for 1999 based on the 2000 Census (Table 17.15). These figures are not adjusted for inflation.

Table 17.15. Median Household Income in Year before Census: 1990 &amp; 2000

Year	Palau	Guam	Northern Mariana Is.	American Samoa	United States
2000	\$ 13,421	\$ 39,317	\$ 22,898	\$ 18,219	\$ 41,994
1990	\$ 8,882	\$ 30,755	\$ 20,644	\$ 16,114	\$ 30,056

Source: Decennial Censuses

Again, the median is the value that divides household income in half — so, 1989, half the households in the United States had incomes above \$30,000, half had incomes below. The median for Guam was slightly higher at \$30,800 in 1989, but lower at \$39,300 in 1999.

But the median incomes for the other Pacific areas lagged behind Guam. The median household income in the CNMI was \$20,600 in 1989 (increasing only to \$22,900 in 2000, but still much higher than for American Samoa or Palau. But Palau, while less than one-third of the U.S. Median in 1989 at \$8,882 was the lowest of all, moved to \$13,400 in 1999, still only one-third of the wages earned in the U.S. or Guam.

**CONCLUSION:** This chapter has presented comparative information from the 1980, 1990 and 2000 Censuses of the United States, Guam, American Samoa, the Commonwealth of the Northern Mariana Islands, and the Republic of Palau. Later, comparative analyses for Pacific Islanders in the United States and in the Pacific Islands similar to those developed after the 1980 census will be possible (see, for example, Levin 1992, Ahlburg and Levin 1990).

## APPENDIX A. ACCURACY OF THE DATA

### Confidentiality of the Data

The 1995, 2000 and 2005 Censuses of Palau followed United States Census Bureau standards for confidentiality and editing of data. To maintain confidentiality as required by U.S. law (Title 13, United States Code), the Bureau of the Census applies a confidentiality edit its census data to ensure that published data do not contain information about specific individuals, households, and housing units. One result of this edit is the introduction of a small amount of uncertainty into some of the census characteristics to prevent identification. The Census Bureau controls the confidentiality edit so that it does not affect the counts.

### Editing of Unacceptable Data

The goal of census data processing is to produce a set of data that described the population as clearly and accurately as possible. To meet this objective, crew leaders reviewed and edited questionnaires during field data collection to ensure consistency, completeness, and acceptability. Census clerks also reviewed questionnaires for omissions, certain inconsistencies, and population coverage. Census personnel conducted a telephone or personal visit follow-up to obtain missing information. The follow-ups considered potential coverage errors as well as questionnaires with omissions or inconsistencies beyond the completeness and quality tolerances specified in the review procedures.

Following field operations, census staff assigned remaining incomplete information and corrected inconsistent information on the questionnaires using imputation procedures during the final automated edit of the data. The use of allocations, or computer assignments of acceptable data, occurred most often when an entry for a given item was lacking or when the information reported for a person or housing unit on an item was inconsistent with other information for that same person or housing unit. In all of Palau's censuses, the general procedure for changing unacceptable entries was to assign an entry for a person or housing unit that was consistent with entries for persons or housing units with similar characteristics. The assignment of acceptable data in place of blanks or unacceptable entries enhanced the usefulness of the data.

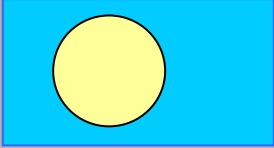

### Sources of Error

Human and machine-related errors occur in any large-scale statistical operation. Researchers generally refer to these problems as *non-sampling errors*. These errors include the failure to enumerate every household or every person in a population, failure to obtain all required information from residents, collection of incorrect or inconsistent information, and incorrect recording of information. In addition, errors can occur during the field review of the enumerators' work, during clerical handling of the census questionnaires, or during the electronic processing of the questionnaires. To reduce various types of non-sampling errors, Census office personnel used several techniques during planning, data collection, and data processing activities. Quality assurance methods were used throughout the data collection and processing phases of the census to improve the quality of the data.

Census staff implemented several coverage improvement programs during the development of census enumeration and processing strategies to minimize under-coverage of the population and housing units. A quality assurance program improved coverage in each census. Telephone and personal visit follow-ups also helped improve coverage. Computer and clerical edits emphasized improving the quality and consistency of the data. Local officials participated in post-census local reviews. Census enumerators conducted additional re-canvassing where appropriate.

## APPENDIX B. QUESTIONNAIRE

<b>P2005-1</b>  <b>2005 CENSUS OF POPULATION AND HOUSING</b>    <b>REPUBLIC</b>  <b>OF</b>  <b>PALAU</b>	<b>A. ED:</b>	<b>B. Block:</b>	<b>C. Household No.:</b>

<b>Office of Planning and Statistics, Republic of Palau</b>	<b>L. If vacant:</b> 1. Regular      2. UHE	If Occupied, FORM _____ of _____
---	---	----------------------------------

## 2005 CENSUS OF PALAU HOUSING

<b>H1a</b> When you told me the names of persons living here on April 1, did you leave anyone out because you were not sure if the person should be listed <b>C</b> for example, someone temporarily away on a business trip, vacation, a newborn baby still in the hospital, or a person who stays here once in a while and has no other home? 1. Yes <span style="float: right;">Determine if you should add the person(s) based on the instructions for Question 1a.</span> 2. No	<b>H7</b> When did ( <i>Person listed on line 1</i> ) move into this (house/apartment)? <div style="border: 1px solid black; width: 150px; height: 30px; margin: 5px auto;"></div>	
<b>H1b</b> When you told me the names of persons living here on April 1, did you include anyone even though you were not sure that the person should be listed <b>C</b> for example, a visitor who is staying here temporarily or a person who usually lives somewhere else? 1. Yes <span style="float: right;">Determine if you should delete the person(s) based on the instructions for Question 1a.</span> 2. No	<b>H8</b> About when was this building first built? <span style="float: right;"><input style="width: 40px; height: 30px;" type="text"/></span>  <div style="display: flex; justify-content: space-between;"> <div>           1. 2004 or 2005            2. 2005 to 2003            3. 2000 to 2004         </div> <div>           4. 1990 to 1994            5. 1980 to 1989            6. 1960 to 1979         </div> <div>           7. 1940 to 1959            8. 1939 or earlier            9. Don't know         </div> </div>	
<b>H2</b> Which best describes this building? Include all apartments, flats, etc., even if vacant. 1 A one-family house detached from any other house 2 A one-family house attached to one or more houses 3 A building with 2 apartments 4 A building with 3 or 4 apartments 5 A building with 5 to 9 apartments 6 A building with 10 to 19 apartments 7 A building with 20 or more apartments 8 A boat, houseboat, or yacht 9 Other <span style="float: right;"><input style="width: 40px; height: 30px;" type="text"/></span>	<b>H9</b> What is the MAIN type of material used for the outside walls of this building? <i>Read each category and mark (X) ONE box.</i> 1. Poured concrete 2. Concrete blocks 3. Metal 4. Wood 5. Other <span style="float: right;"><input style="width: 40px; height: 30px;" type="text"/></span>	
<b>H3</b> Is this (house/apartment) <b>C</b> 1. Owned by you or someone in this household with a mortgage or loan? 2. Owned by you or someone in this household free and clear (without a mortgage, incl traditional/customary practices?) 3. Rented for cash rent? 4. Occupied without payment of cash rent? <span style="float: right;"><input style="width: 40px; height: 30px;" type="text"/></span>	<b>H10</b> What is the MAIN type of material used for the roof of this building? <i>Read each category and mark (X) ONE box.</i> 1. Poured concrete 2. Metal 3. Wood 4. Thatch 5. Other <span style="float: right;"><input style="width: 40px; height: 30px;" type="text"/></span>	
<b>H4</b> <i>Ask only if someone in this household OWNS OR IS BUYING this house, apartment, mobile home, or boat</i> <b>C</b> What is the value of this property; that is, how much do you think this (house and lot) would sell for it if were for sale? \$ <span style="float: right;"><input style="width: 100px; height: 30px;" type="text"/></span>	<b>H11</b> What is the MAIN type of material used for the foundation of this building? 1. Concrete 2. Wood pier or pilings 3. Other <span style="float: right;"><input style="width: 40px; height: 30px;" type="text"/></span>	
<b>H5</b> <i>Ask only if this house is RENTED FOR CASH RENT</i> <b>C</b> What is the monthly rent? <i>If rent is NOT PAID BY THE MONTH, see your job instructions on how to figure a monthly rent.</i> \$ <span style="float: right;"><input style="width: 100px; height: 30px;" type="text"/></span>	<b>H12</b> How many rooms do you have in this house/apartment? Count living rooms, dining rooms, kitchens, and bedrooms, but do NOT count bathrooms, balconies, foyers, or halls. <span style="float: right;"><input style="width: 40px; height: 30px;" type="text"/></span>	
<b>H6</b> <i>If this is a ONE-FAMILY HOUSE</i> <b>C</b> Is there a business (such as a store or barber shop) or a medical office on this property? <span style="float: right;"><input style="width: 40px; height: 30px;" type="text"/></span>	<b>H13</b> How many bedrooms do you have; that is, how many bedrooms would you list if this (house/apartment) were on the market for sale or rent? <span style="float: right;"><input style="width: 40px; height: 30px;" type="text"/></span>	
<b>VACANT UNITS <b>C</b> FOR ENUMERATOR USE</b>		
<b>C1</b> Vacancy Status <span style="float: right;"><input style="width: 40px; height: 30px;" type="text"/></span> 1. For rent 2. For sale only 3. Rented or sold, not occupied 4. For seasonal/recreational/Occasional 5. For migrant workers 6. Other vacant	<b>C2</b> Is this unit boarded up? <span style="float: right;"><input style="width: 40px; height: 30px;" type="text"/></span> 1. Yes 2. No	<b>D</b> Months vacant <span style="float: right;"><input style="width: 40px; height: 30px;" type="text"/></span> 1. Less than 1 2. 1 up to 2 3. 2 up to 6 4. 6 up to 12 5. 12 up to 24 6. 24 or more

2005 CENSUS OF PALAU HOUSING	
<b>H14</b> Do you have hot and cold piped water? 1. Yes, in this unit 2. Yes, in this building 3. No, only cold piped water in this unit 4. No, only cold piped water in this building 5. No, only cold piped water outside this building 6. No piped water	<b>H26</b> Is this building connected to a public sewer? 1. Yes, connected to public sewer 2. No, connected to septic tank or cesspool 3. No, use other means
<b>H15</b> If Yes, What type of energy does your water heater use most? 1. Electricity 2. Gas 3. Solar 4. Other fuels	<b>H27</b> Are your MAIN cooking facilities inside or outside this building? 1. Inside this building } Go to H28 2. Outside this building } 3. No cooking facilities C Skip to H30
<b>H16</b> Do you have a bathtub or shower? 1. Yes, in this unit 2. Yes, in this building 3. Yes, outside this building 4. No	<b>H28</b> Which FUEL is used MOST for cooking in this (house/apartment)? [Check all that apply] 1. Electricity 2. Gas: bottled or tank (LPG) 3. Kerosene 4. Biomass (Charcoal, wood) 5. Other 6. No fuel used
<b>H17</b> Do you have a flush toilet? 1. Yes, in this unit 2. Yes, in this building 3. Yes, outside this building 4. No, outhouse or privy 5. No, other or none	<b>H29</b> Do you also use a microwave oven? 1. Yes 2. No
<b>H18</b> Does this house/apartment have electric power? 1. Yes 2. No	<b>H30</b> Do you have a refrigerator in this building? If "Yes," ask C What type? 1. Yes, electric 2. Yes, gas 3. No refrigerator
<b>H19a</b> Do you have a telephone in this (house/apartment)? 1 Yes 2 No <b>H19b</b> Do you have a cell phone? 1 Yes 2 No <b>H19c</b> Do you have personal computer? 1 Yes 2 No	<b>H31</b> Do you have a sink with piped water? 1. Yes 2. No
<b>H20</b> Do you have a battery operated radio? Count car radios, transistors, and other battery operated sets in working order or needing only new battery for operation. 1. Yes, 1 or more 2. No	<b>H32a</b> How many automobiles, vans, and trucks of one-ton capacity or less are kept at home for use by members of this household? <b>H32b</b> How many boats are kept at home for use by members of this household?
<b>H21</b> Do you have a television set? 1. Yes 2. No	<b>H33</b> What is the average monthly cost for electricity for this house/apartment? \$
<b>H22</b> Do you have air conditioning? 1. Yes, a central air-conditioning system 2. Yes, 1 individual room unit 3. Yes, 2 or more individual room units 4. No	<b>H34</b> What is the average monthly cost for gas (not kerosene) for this house/apartment? \$
<b>H23</b> Do you get water from C 1. A public system only? 2. A public system and cistern? 3. A cistern, tanks, or drums only? 4. A public standpipe? 5. Some other source like an individual well or a spring?	<b>H35</b> What is the average monthly cost for water for this house/apartment? \$
<b>H24</b> Do you use the public water system for cooking? 1. Yes 2. No, use rainwater 3. No, use bottled water 4. No, use both rainwater and bottled water	<b>H36</b> What is the average monthly cost for kerosene, oil, coal, etc. for this house/apartment? \$
<b>H25</b> Do you use the public water system for drinking? 1. Yes 2. No, use rainwater 3. No, use bottled water 4. No, use both rainwater and bottled water	<b>H37</b> Where do you buy most of your prescription and non Prescription drugs? 1. Hospital 2. Clinic in own State 3. Clinic outside State 4. Drug/grocery store 5. Elsewhere 6. Cannot afford to purchase
	<b>H38</b> How much remittances did this household give or send to all persons inside or outside Palau last year? \$ Where was the largest amount sent outside of Palau?

2005 CENSUS OF REPUBLIC OF PALAU POPULATION			
<b>1a Name (from list, page 1)</b>		<b>12 At any time since February 1, 2005, has .. attended regular school or college?</b> Include only nursery school, kindergarten, elementary school, and schooling which leads to a high school diploma or a college degree. <i>If "Yes," ask C Public or private?</i> 1. No, has not attended since February 1 2. Yes, public school, public college 3. Yes, private school, private college	
<b>1b Person Number (from list, page 1)</b> 01	<b>2 Is...male or fem</b> 1. Male 2. Female	<div style="border: 1px solid black; width: 40px; height: 20px; margin: 5px auto;"></div> <div style="border: 1px solid black; width: 40px; height: 20px; margin: 5px auto;"></div>
