Overview

ABSTRACT

A strong evidence base is needed to understand the socioeconomic implications of the coronavirus pandemic for the Solomon Islands. High Frequency Phone Surveys (HFPS) are set up to understand these implications over the years. This data is the third of the five planned rounds of mobile surveys.

Two rounds of the HFPS are already completed in June 2020 (Round 1) and Dec 2020-Jan 2021 (Round 2). Round 3 interviewed 2,503 households across the country between 29th June 2021 and 11th Aug 2021, on topics including Vaccines of COVID-19, Employment & Income, Food security, Coping strategies, Health, and Public trust and security. Telephone interviews were conducted through a Solomon Islands call center set up by Tebbutt Research.

Sampling

Sampling Procedure

As the objective of the survey was to measure changes as the pandemic progresses, Round Three data collection sought to re-contact all 2,882 households contacted in Round Two. The protocols for re-contact were a maximum of 3 attempts per caller shift, spaced between 1.5 and 2.5 hours apart depending on whether the phone was busy or there was no answer, and 15 attempts in total. Of the Round Two households, 1,182 were successfully re-contacted.

Honiara was over-represented in the sample (accounting for 36.9 percent of the sample). Compensating factors for these differences were developed and included in the re-weighting calculations. Due to the limited sample sizes outside of Honiara, most results are disaggregated into only three geographic regions: Honiara, other urban areas, and rural areas.

To reach the target sample size of at least 2500 households, 980 new replacement households were added to the World Bank survey. The final sample of completed interviews was 2,503. The employment questions were asked for both the respondent and the household head by proxy (if different from the respondent), yielding a total sample size for the individual-level employment analysis of 3,188.

Further information regarding weighting can be found in the HFPS Round One and HFPS Round Two reports, which followed the same weighting methodology. Because of considerable attrition between rounds, most statistics showing changes through time reflect data from repeated cross sections rather than panels.

Response Rate

Response rate for returning households: 41.01%.

Weighting

The sampling weights were developed for round three of the Solomon Islands high frequency phone survey in a series of steps. As the main shortcoming of using random digit dialing is that the resulting data is representative of the population of mobile phone owners, and according to the most recent data (from International Telecommunication Union, World Telecommunication/ICT Development Report and data base (2018)) available for mobile phone penetration estimates usage as 74 percent of the population, coverage is concentrated in population centers, and better off households and individuals are more likely to have a mobile phone which is charged and turned on. Therefore, the pool of respondents is very different from a representative sample of the Solomon Islands population.

Auxiliary data to serve as inputs to the weights is severely limited as there are few recent nationally representative sources. The results from the recently completed census are not yet available and the last Household Income and Expenditure Survey (HIES) was from 2012/2013. The most recent nationally representative dataset including a measure of welfare was the Solomon Islands Demographic and Health Survey 2015 (DHS).

Weights are required for unbiased estimation. because the survey was administered by mobile phones, the respondents were a representative sample of mobile phone holders, not the population overall, and non-random non-response can exacerbate these differences. Previous literature has shown that mobile phone holders are more likely to be male, urban, wealthier, and more highly educated. To make inferences at the level of the population instead of mobile phone holders, it was necessary to reweight the survey data.

Definitionally, the DHS deciles each contain 10 percent of the sample. Using the maximum and minimum threshold values for the DHS deciles to map the mobile phone survey results, it is clear there is a strong bias toward the upper deciles (wealthier) households in the distribution. While weighting can adjust for the bias, there are only 14 and 14 observations in the bottom two deciles of the distribution, respectively. These sample sizes are too small to yield estimates of adequate precision to report results.

Therefore, direct analysis is limited to the bottom four deciles (bottom 40 percent), and then the middle two deciles (middle

quintile) and top four deciles (top 40 percent). In addition, each statistic is reported with its confidence interval and all econometric findings are statistically significant, unless otherwise stated.

The "weight" variable in the household dataset is called "weight_hh" and represents household cross-sectional weights, whereas the "weight" variable in the individual data set is called as "weight_ind" and represents individual cross-sectional weights.

Questionnaires

Overview

The questionnaire - that can be found in the External Resources of this documentation - was developed both in English and in Solomons Pijin.

The survey instrument for the third round consisted of the following modules:

- Basic information,
- Vaccines of COVID-19
- Employment & ESP,
- Income,
- Food access and food security,
- Coping strategies,
- Health
- Public trust and security,
- and Assets and wellbeing.

Data Collection Notes

Tebbutt Research is a full-service market research and social research agency with expertise in Pacific Islands research. The dates of implementation were 29th June 2021 through 11th Aug 2021, and the implementation method was Random Digit Dialing using mobile phone numbers. Since phone numbers in the Solomon Islands do not contain any location information, it was not possible to do any geographical targeting, and therefore the sample was developed based on targets for completed interviews by location.

Data Processing

Data Editing

At the end of data collection, the dataset was cleaned by the World Bank team. This included formatting, and correcting results based on monitoring issues, enumerator feedback and survey changes. Data was edited using STATA.

The data is presented in two data sets: household data set and individual data set. The total number of observations in the household data set is 2,503 and 3,188 in the individual data set. The individual data set mentions the employment information for all the household members, whereas the household data set contains information about vaccines of COVID-19, food access and food security, coping strategies, health, public trust and security, and assets.

Data Appraisal

Other forms of Data Appraisal

Imputation was done for missing education values when calculating the individual weights

| Description | <p>This file is the 'Monitoring COVID-19 Impacts on Households in Solomon Islands' report that is highlighting some of the main results of the third round of the 2021 High Frequency Phone Survey (HFPS) of Solomon Islands.</p> |
| Abstract | <p>This note focuses on household level impacts of COVID-19 in Solomon Islands for the first half of 2021 based on data from the third round of the World Bank's High Frequency Phone Surveys (HFPS) and UNICEF's Social-Economic Impact Assessment Survey (SIAS). The survey covered topics including employment and income, COVID-19 vaccination, basic services, food security and nutrition, coping strategies, public services, and public trust and security. While widespread transmission of COVID-19 did not occur in 2021, COVID-19 preparedness measures such as border closures and precautionary public health measures, as well as weak external demand may have had an impact on the welfare of households.</p> |

| Description | This file is the "Employment and Income Impacts of COVID-19 in Solomon Islands" report that is highlighting some of the main vaccination-related results of the third round of the 2021 High Frequency Phone Survey (HFPS) of Solomon Islands. |

| | |
|----------|--|
| Abstract | This brief details COVID-19 vaccination rates, reasons for vaccine hesitancy, access to healthcare, sanitation, and education in mid 2021. Low rates of COVID-19 vaccination were a sign of vaccine hesitancy, with nine percent of survey respondents aged over 18 being vaccinated, though official statistics put this figure even lower, at five percent. While widespread transmission of COVID-19 only began in Solomon Islands in 2022, border closures and precautionary public health measures may have had an impact on the welfare of households. The findings in this brief come from the third round of the World Bank's High Frequency Phone Surveys (HFPS) , and UNICEF's Social-Economic Impact Assessment Survey (SIAS) . |
