Overview

ABSTRACT

A strong evidence base is needed to understand the socioeconomic implications of the coronavirus pandemic for the Papua New Guinea. High Frequency Phone Surveys (HFPS) are set up to understand these implications over the years. This data is the fifth round in a series of mobile phone surveys.

Four prior rounds of the HFPS were conducted in June 2020 (Round 1), Dec 2020-Jan 2021 (Round 2), July-Aug 2021 (Round 3), and Nov 2021-Dec 2021 (Round 4). Round 5 interviewed 2,630 households across the country between May 30, 2022, and June 22, 2022, on topics including vaccines of COVID-19, employment, income, food security, health, coping strategies, public trust and security, assets and well-being.

Sampling

Sampling Procedure

As the objective of the survey was to measure changes as the pandemic progresses, Round Five data collection sought to re-contact all 2,714 households contacted in Round Four. Five hundred to six hundred calls are done each day, and unsuccessful numbers were attempted 4 to 6 times a day. Of the Round Four households, 1,224 were successfully re-contacted.

For PNG round 5, a total of 2,638 successful surveys were completed, out of which 2,630 were willing to participate. The size of the final analytical sample is 2,630, among which 1,224 households were pre-loaded, and 1,406 were replacement households. Questionnaires and preloaded numbers were supplied by WBG team to support dialing out to lead list for the campaign survey. For the replacement numbers, 10,000-12,000 extra leads (replacement numbers) were extracted from the survey firm's (Digicel's) database. Numbers were randomly allocated to enumerators per listings for outbound dialing, and the numbers were equally distributed amongst each PNG region and province to collect quality data as per the requirements. A total of 89 districts were contacted for the WBG survey.

For more information on sampling, please refer to the presentation slides provided in the External Resources.

Response Rate

Response rate for returning households: 45.10%.

Weighting

The sampling weights were developed for round five of the Papua New Guinea high frequency phone survey in a series of steps. Information from the 2016-2018 Demographic and Health Survey (DHS) was used to construct weights and to reflect nationally representative estimates of the socioeconomic impacts of COVID-19. While a good starting point, this strategy does not address the main shortcoming of using random digit dialing, which is that the resulting data is representative of the population of mobile phone owners rather than the population across the country. According to the most recent data (from Digital 2021 report for Papua New Guinea by DataReportal: <https://datareportal.com/reports/digital-2021-papua-new-guinea>), the number of mobile connections in Papua New Guinea in January 2021 was equivalent to 34.4% of the total population. Coverage is concentrated in population centers and better off households and individuals are more likely to have a mobile phone which is charged and turned on. Therefore, the pool of respondents is very different from a representative sample of the Papua New Guinea population.

Weights are required for unbiased estimation, because the survey was administered by mobile phones, the respondents were a representative sample of mobile phone holders, not the population overall; and non-random non-response can exacerbate these differences. Using the 2016-2018 DHS, and comparing individuals that own a phone (either landline or a mobile phone) and those without one, we find that phone holders are more likely to be urban, wealthier, and more highly educated. To make inferences at the level of the population instead of mobile phone holders, it was necessary to reweight the survey data.

Definitionally, the DHS deciles each contain 10 percent of the sample. Using the maximum and minimum threshold values for the DHS deciles to map the mobile phone survey results, it is clear there is a strong bias toward the upper deciles (wealthier) households in the distribution. While weighting can adjust for the bias, there are only 0 and 57 observations in the bottom two deciles of the distribution, respectively. These sample sizes are too small to yield estimates of adequate precision to report results.

Therefore, direct analysis is limited to the bottom four deciles (bottom 40 percent), and then the middle two deciles (middle quintile) and top four deciles (top 40 percent). In addition, each statistic is reported with its confidence interval and all econometric findings are statistically significant, unless otherwise stated.

The "weight" variable in the household dataset is called 'weight_hh' and represents household cross-sectional weights. The individual data set contains weights for vaccine analysis and employment analysis and are named as covid_weight and

emp_weight, respectively.

Questionnaires

Overview

The questionnaire - that can be found in the External Resources of this documentation - was developed both in English and in Pidgin.

The survey instrument for the fifth round consisted of the following modules:

- Basic information,
- Vaccines of COVID-19,
- Employment and Income,
- Access food & food security,
- Coping strategies,
- Health,
- Public trust and security,
- and Assets and wellbeing.

Data Collection Notes

The data was collected by Digicel. Digicel is a mobile phone network provider in Papua New Guinea. The dates of implementation were between May 30, 2022, and June 22, 2022, and the implementation method was Random Digit Dialing using mobile phone numbers. Since phone numbers in the Papua New Guinea do not contain any location information, it was not possible to do any geographical targeting, and therefore the sample was developed based on targets for completed interviews by location.

Questionnaires

The questionnaire - that can be found in the External Resources of this documentation - was developed both in English and in Pidgin.

The survey instrument for the fifth round consisted of the following modules:

Data Processing

Data Editing

At the end of data collection, the dataset was cleaned by the World Bank team. This included formatting, and correcting results based on monitoring issues, enumerator feedback and survey changes. Data was edited using STATA. The data is presented in two data sets: household data set and individual data set. The total number of observations in the household data set is 2,630 and is 3,445 in the individual data set. The individual data set contains the employment, income, vaccine, and public trust information for all individuals, whereas the household data set contains information about public services, staple food access and food security, coping strategies, health care, and awareness of COVID-19.

Other Processing

Data was collected and managed using the Survey Solutions software package. Imputation was done for missing education values when calculating the individual weights.
